Collective Intelligence in Computer-Based Collaboration John B. Smith, 1994-08-01 Proposing a new paradigm for Computer Supported Cooperative Work CSCW this ground breaking book presents a research agenda for developing and testing that paradigm It constitutes the first attempt to outline a comprehensive model of collaboration that integrates the cognitive conceptual and social dynamics of groups The challenge faced by all groups

engaged in intellectual work is on the one hand to divide the task so that efforts of individual members may proceed in parallel and on the other hand to synthesize their separate contributions to form a coherent whole Addressing this challenge Smith examines the general form of a theory of computer based collaboration that extends across different tasks and working situations He uses the work of Newell Simon and Anderson as a base from which to consider a group as a form of distributed information processing system Within groups there are constructs analogous to human long term and short term memory conceptual processes and problem solving and knowledge construction strategies He discusses two metacognitive issues awareness and control as they occur in collaborative behavior And he reviews a number of advanced computer systems that support collaboration focusing on their impact on the thinking and behavior of groups Smith s theoretical framework combines elements of Information Processing System theory and its detailed process models of cognitive behavior with the situated perspective of activity theory The book suggests new and useful ways of conceiving problems and solutions to all those interested in the ways in which people interact with each other and with computers to achieve goals

Democratic Reason Hélène Landemore, 2013 Individual decision making can often be wrong due to misinformation impulses or biases Collective decision making on the other hand can be surprisingly accurate In *Democratic Reason* Hélène Landemore demonstrates that the very factors behind the superiority of collective decision making add up to a strong case for democracy She shows that the processes and procedures of democratic decision making form a cognitive system that ensures that decisions taken by the many are more likely to be right than decisions taken by the few Democracy as a form of government is therefore valuable not only because it is legitimate and just but also because it is smart Landemore considers how the argument plays out with respect to two main mechanisms of democratic politics inclusive deliberation and majority rule In deliberative settings the truth tracking properties of deliberation are enhanced more by inclusiveness than by individual competence Landemore explores this idea in the contexts of representative democracy and the selection of representatives She also discusses several models for the wisdom of crowds channeled by majority rule examining the trade offs between inclusiveness and individual competence in voting When inclusive deliberation and majority rule are combined they beat less inclusive methods in which one person or a small group decide *Democratic Reason* thus establishes the superiority of democracy as a way of making decisions for the common good
