Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18 Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence computer science databases programming languages and operations research Constraint programming is currently applied with success to many domains such as scheduling planning vehicle routing configuration networks and bioinformatics The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

**SAT 2005** Enrico Giunchiglia, Toby Walsh, 2007-01-21 This book is devoted to recent progress made in solving propositional satisfiability and related problems Propositional satisfiability is a powerful and general formalism used to solve a wide range of important problems including hardware and software verification The core of many reasoning problems in automated deduction are propositional Research into methods to automate such reasoning has therefore a long history in artificial intelligence In 1957 Allen Newell and Herb Simon introduced the Logic Theory Machine to prove propositional theorems from Whitehead and Russell's Principia mathematica In 1960 Martin Davis and Hillary Putnam introduced their eponymous decision procedure for satisfiability reasoning though for space reasons it was quickly superseded by the modified procedure proposed by Martin Davis George Logemann and Donald Loveland two years later In 1971 Stephen Cook's proof that propositional satisfiability is NP Complete placed satisfiability as the cornerstone of complexity theory

**Constraint Logic Programming using Eclipse** Krzysztof R. Apt, Mark Wallace, 2006-12-21 Constraint logic programming lies at the intersection of logic programming optimisation and artificial intelligence It has proved a successful tool in many areas including production planning transportation scheduling numerical analysis and bioinformatics Eclipse is one of the leading software systems that realise its underlying methodology Eclipse is exploited commercially by Cisco and is freely available and used for teaching and research in over 500 universities This book has a two fold purpose It's an introduction to constraint programming appropriate for one semester courses for upper undergraduate or graduate students in computer science or for programmers wishing to master the practical aspects of constraint programming By the end of the book the reader will be able to understand and write constraint programs that solve complex problems Second it provides a systematic introduction to the Eclipse system through carefully chosen examples that guide the reader through the language and illustrate its power versatility and utility
