North America in the first half of the twentieth century exploring the development of colloid chemistry in the laboratory and
the science's reception in the wider research community It also gives a fascinating insight into the new interest in and

now an active and thriving community of scientists engineers and technologists but there was a time not so long ago when
there was no such community The prehistory of polymer science helps to provide key insights into current issues and
historical problems The story will be divided into an ancient period from Greek times to the creation of the molecular
consensus a nascent period from Dalton to Kekule to van t Hoff and a period of paradigm formation and controversy from
Staudinger to Mark to Carothers The prehistory concludes with an account of the epochal 1935 Discussion of the Faraday

future directions The book is divided into six parts Part I reviews the evolution of theoretical models for surfactant self
assembly and introduces a model for interpreting ion specific effects on aggregate properties Part II focuses on interactions
of surfactant solutions with solid supports uses contact angles to understand hydrophobic hydrophilic changes in a lipid layer
uses surface tension to understand molecular arrangements at interfaces reviews spreading phenomena discusses pattern
