

Nonlinear hyperbolic systems of conservation laws (4)

High-resolution methods: modified high-order finite-difference methods with **appropriate** amount of numerical dissipation in the vicinity of a discontinuity.

A finite-difference scheme is a time-marching procedure which permits to obtain approximations to the solution in the mesh points \bar{u}_j^{n+1} from the approximations in the previous time steps \bar{u}_j^n

Quantity \bar{u}_j^n is an approximation to $\bar{u}(x_j, t^n)$ but in the case of a conservation law it is often preferable to view it as an approximation to the average of $\bar{u}(x, t)$ within the numerical cell $[x_{j-1/2}, x_{j+1/2}]$ ($x_{j+1/2} = (x_j + x_{j+1})/2$)

$$\bar{u}_j^n \approx \frac{1}{\Delta x} \int_{x_{j-1/2}}^{x_{j+1/2}} \bar{u}(x, t^n) dx$$

consistent with the integral form of the conservation law

For hyperbolic systems of conservation laws, schemes written in **conservation form** guarantee that the convergence (if it exists) is to one of the weak solutions of the original system of equations (**Lax-Wendroff theorem 1960**).

A scheme written in conservation form reads

$$\bar{u}_j^{n+1} = \bar{u}_j^n - \frac{\Delta t}{\Delta x} (\hat{f}(\bar{u}_{j-r}^n, \bar{u}_{j-r+1}^n, \dots, \bar{u}_{j+q}^n) - \hat{f}(\bar{u}_{j-r-1}^n, \bar{u}_{j-r}^n, \dots, \bar{u}_{j+q-1}^n))$$

where \hat{f} is a consistent numerical flux function:

$$\hat{f}(\bar{u}, \bar{u}, \dots, \bar{u}) = \vec{f}(\bar{u})$$

Shock Waves and Reaction—Diffusion Equations
 Joel Smoller, 2012-12-06 For this edition a number of typographical errors and minor slip ups have been corrected In addition following the persistent encouragement of Olga Oleinik I have added a new chapter Chapter 25 which I titled Recent Results This chapter is divided into four sections and in these I have discussed what I consider to be some of the important developments which have come about since the writing of the first edition Section I deals with reaction diffusion equations and in it are described both the work of C Jones on the stability of the travelling wave for the Fitz Hugh Nagumo equations and symmetry breaking bifurcations Section II deals with some recent results in shock wave theory The main topics considered are L Tartar s notion of compensated compactness together with its application to pairs of conservation laws and T P Liu s work on the stability of viscous profiles for shock waves In the next section Conley s connection index and connection matrix are described these general notions are useful in constructing travelling waves for systems of nonlinear equations The final section Section IV is devoted to the very recent results of C Jones and R Gardner whereby they construct a general theory enabling them to locate the point spectrum of a wide class of linear operators which arise in stability problems for travelling waves Their theory is general enough to be applicable to many interesting reaction diffusion systems
