## **Executive Summary**

Many planners and decision makers in the area of municipal solid waste, as yet lack thorough understanding of the whole chain of waste management system and its impact on environmental quality and public health. By fact, with their plans and decisions, they have role on engendering the influence on the urban population and the cityscape formation. There have been publications on the Decision Support Models (DSMs) for regional sustainable waste management to assist planners and decision makers in finding the optimum way to manage municipal solid waste.

However most of existing models are primarily focusing on cost or environmental analysis. There are few that consider other crucial factors such as the demographic condition, the characteristic of urban form and urban infrastructure, land transformation aspects due to urban development, etc. Consequently, such models suffer from deficiencies and are constrained when they meet local cultural requirements. Thus it may leads to imprecise decisions. Those factors are the critical issues from regional development points.

This paper reviews some of DSMs identified in the literature and pointing out the planner and decision makers' contribution to the DSMs development. The main objective of this paper is: 1) compare the models of developed and developing countries; 2) review the urban planner and waste managers' contribution in the development of DSMs identified in the literature; and 3) to suggest some approaches for better waste management DSM.

Findings have shown that models in developed countries have existed already for a long time. Models from developed countries seem to have a wider scope compared to the models from developing countries. But on the contrary, developing countries have more urgent needs to use DSM, mostly due to hygiene issues. Models from both developed and developing countries need to consider social aspects, particularly public involvement.

## **Introduction**

More than 50% of the world's total population today lives in urban areas. Solid waste management is one of the serious issues that are very close-coupled with the increasing world's population and population density. To find most suitable solutions on waste management, decision support models are frequently developed.
