QCD and Deep Inelastic Scattering

In this chapter QCD and its properties are reviewed. QCD is a gauge theory based on the non-Abelian color symmetry group $SU(3)$. In QCD the gluon is a mediator particle of color interactions carrying color charge, in contrast with the photon in Quantum Electrodynamics (QED). In this review, starting from the Lagrangian of QCD, both perturbative QCD and nonperturbative QCD are presented. In the high energy region, the perturbative QCD approach is a very powerful method to link elementary quantities and physical quantities through a factorization theorem in order to be able to interpret the theoretical results and experimental data. In the factorization theorem, the differential cross section is factorized based upon all orders of the running coupling constants, $\alpha_S(Q^2)$. A summary review of QCD and its properties, the quark parton model (QPM), DIS, factorization theorem, and QCD evolution is presented in the next sections.

2.1 Quantum Chromodynamics

QCD poses a fundamental theory of the strong interaction, where quarks and gluons are its degrees of freedom and it is a part of the $SU(3) \times SU(2) \times U(1)$ standard model of particle physics. The dynamical interaction of the quarks and gluons renders the color interactions. QCD is constructed based upon the gauge group $SU(3)_C$ in color space which is non-Abelian gauge group. In group theory, $SU(3)$ means the special unitary group in 3 dimensions which involves the unitary set of 3×3 matrices with determinant one. The set has nine linearly independent unitary complex matrices¹. One has determinant -1 and there are a total of eight independent component matrices in the matrix space. This corresponds to eight different generators of $SU(3)$ ². In QCD, the quark-quark interaction and gluons interaction as potential part and kinetic (free)

¹A complex matrix has $2N^2$ degrees of freedom. Unitary has N^2 constraints

²The number of generators of the $SU(N)$ is $N^2 - 1$. Hence the number generators is 8 for $SU(3)$.
