Abstract

These notes were written for a tutorial in JICSLP (Washington, 1992) and are not intended to be a comprehensive survey of the field.

We are concerned with *dooD*, i.e. deductive object-oriented databases (systems). We briefly review *ooD* systems (object-oriented database management systems) and *deductive database systems* (the deductive ones). A main purpose is to try to clarify these concepts. As we shall see, although there is already a conference entitled *dooD* and a large body of literature on the topic, the meaning of *dooD* is not yet clear. The issues are not precise and we are still looking forward to the first real implementation of a *dooD* system. We will try to present the motivations, the main achievements so far, and the open questions.

1 Introduction

Data intensive applications are nowadays currently written using C and SQL. This is a major source of difficulties since these two languages are based on different paradigms. Furthermore, the user interface is often implemented using specific tools and in particular 4th generation languages and yet different environments. Therefore, application programmers have to deal with tables and tuples at the SQL level, pointers and records at the C level, objects, windows or menus at the interface level. The prime goal of *deductive object-oriented database systems* is to provide a uniform rule-based environment to facilitate the design and maintenance of data intensive applications. The challenge is to improve application programmer's productivity while still guaranteeing reasonable performances. It is not clear that such a goal can be achieved. Also, as we shall see, from a scientific viewpoint, the topic is yet rather ill defined. However, we believe that the research community should participate in the study of these systems: (i) there are indications that such systems will become available and (ii) they raise a number of interesting technical issues.

¹A subtlety in the term *dooD* is that the first "D" can be understood as *deductive* or as *declarative*. In this note, we often think of it as *declarative*, or in other words, we use "deductive" in a very liberal sense.

Ling,Alberto O. Mendelzon,Laurent Vieille,1995-11-15 This book constitutes the refereed proceedings of the 4th International Conference on Deductive and Object Oriented Databases DOOD 95 held in Singapore in December 1995 Besides two keynote papers by Stefano Ceri and Michael Kifer the book contains revised full versions of 28 papers selected from a total of 88 submissions The volume gives a highly competent state of the art report on DOOD research and advanced applications The papers are organized in sections on active databases query processing semantic query optimization transaction management authorization implementation and applications *Deductive and Object-Oriented Databases* W. Kim,J.-M. Nicolas,S. Nishio,2014-06-28 Deductive databases and object oriented databases are at the forefront of research in next generation intelligent database systems Object oriented programming and design methodologies have great potential promising to reduce the complexity of very large software systems in such domains as computer aided design and manufacturing integrated office information systems and artificial intelligence Object oriented database systems will enhance the programmer user productivity of such systems Research into deductive databases is aimed at discovering efficient schemes to uniformly represent assertions and deductive rules and to respond to highly expressive queries against the knowledge base of assertions and rules This area of research is strongly interacting with Logic Programming which has developed in parallel sharing Logic as a common basis Recently research has aimed at integrating the object oriented paradigm and rule based deduction to provide a single powerful framework for intelligent database systems The aim of this book is to present research papers and technical discussions between researchers concerned with deductive databases object oriented databases and their integration Deductive and Object-oriented Databases C. Delobel,Michael Kifer,Yoshifumi Masunaga,1991 This volume is the proceedings of the Second International Conference on Deductive and Object Oriented Databases DOOD During the last decade deductive and object oriented systems have received a great deal of attention but for the most part these two fields were evolving independently of each other Today there is a large body of work suggesting

that the deductive and object oriented paradigms complement each other The object oriented paradigm is characterized by its view of the data whereby information is grouped around objects with complex internal structure accessed via methods The declarative paradigm is centered around the idea that data manipulation must be done through a declarative logic based language It is hoped that these two aspects brought together in one system will provide an integrated framework for a new database technology The DOOD conference brings together researchers and developers in the fields of deductive and object oriented databases to stimulate technical discussion and accelerate the integration of the two technologies This volume contains 28 contributed papers selected from 98 submissions and two invited papers by world renowned researchers

Nishio, 1989 Abstract There have been many proposals for extensions of relational databases It can be considered that two major streams of them are DDBs and OODBs Research on fusion or integration of their advantages has been being done at the forefront of research on database and logic programming For the target the first international conference on deductive and object oriented databases DOOD89 was held in Kyoto In this paper we propose a framework for the extensions along these lines and introduce some research results such as psi term O logic F logic DOT and hierarchical deductive databases in the framework and discuss future directions

LOGIDATA+: Deductive Databases with Complex Objects Paolo Atzeni, 1993-07-29 This book presents a collection of coordinated scientific papers describing the work conducted and the results achieved within the LOGIDATA project a research action funded by the Italian national research council CNR The aim of the LOGIDATA project is the definition of advanced database systems which significantly extend the functionalities of the current systems with specific reference to the application areas for which relational systems are not considered satisfactory These new systems will allow the definition of data with complex structures the representation of semantic relationships

between objects and the use of powerful query and update languages They will be based on a combination of techniques originating from relational databases and logic programming with contributions from object oriented programming The goal of the LOGIDATA project is the design definition and prototype implementation of a database management system with complex structures and a class hierarchy to be accessed through a rule based language This book presents an integrated view of the project at the end of the first phase The second phase will be mainly concerned with the implementation of prototypes
