

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of hours worked?

- What is elasticity? What kinds of numbers can elasticity take? Is it unitless?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Key concepts:

Two things matter to most economists:

the change in price and quantity and the response of those

two things when facing uncertainty. The opportunity cost of your time, the value of knowing something new (and so on).

How can we measure how much we want and how much we have? If you have your good, how many hours would you work to sell your good? Or what if you don't have it?

Example:

- Some good. Quantity measured how much and various opportunity changes in other variables.
 - One type of elasticity measures how much demand for other variables will fall if one falls (negative)
- Definition:
 - Measuring is a technical measure of the responsiveness of Q^D to P or Q^S to one of its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will look at this sign, and learn different methods to compute it.

Example:

The price elasticity of demand is 0.5. If the price of a good falls by 10%, the quantity demanded will rise by 5%.

Calculating Percentage Change

Price falls from 100 to 90, meaning a 10% change in P .

Quantity falls.

Quantity falls from 100 to 95, meaning a 5% change in Q .
