

Thus we have Blass's result that this game is determined if and only if there is a \mathcal{W} -subtree of $[\omega]^{<\omega}$ with trunk s_0 all or none of whose branches are in \mathcal{X} . A corollary, granted the difficult but well-known fact of Borel determinacy, is the Galvin–Prikry theorem: if \mathcal{X} is a Borel subset of $[\omega]^\omega$, then there is an infinite $H \subset \omega$ all or none of whose infinite subsets are in \mathcal{X} . By further analyzing these games, Blass also obtains Silver's theorem which extends the Galvin–Prikry theorem to analytic sets. He shows that the collection \mathcal{C} of subsets of $[\omega]^\omega$ for which the game is determined for each s_0 forms a σ -algebra, and that the subcollection \mathcal{I} for which \forall has a winning strategy for all s_0 forms a σ -ideal; these share many familiar properties with the σ -algebra of Lebesgue measurable sets and its ideal of measure zero sets. And, just as the latter pair is used in forcing to produce random reals, so Blass uses the former to good advantage. To take just one example, he shows that if \mathcal{W} is a P-point, then forcing with $\mathcal{C}/\mathcal{I} - \{0\}$ does not add either Cohen or random reals; more strongly, if A is any real added in the forcing extension, then in $V[A]$ there is a function from ω to ω eventually above any ground model function.

Both papers are clearly written, though not exactly easy reading; each repays multiple readings of varying depth and detail.

PETER J. NYIKOS

JOHN M. VICKERS. *Chance and structure. An essay on the logical foundations of probability.* Clarendon library of logic and philosophy. Clarendon Press, Oxford University Press, Oxford and New York 1988, viii + 244 pp.

Survey: The main body of the book consists of five chapters. Chapter 3 is entitled *Carnapian logical probability*. It presents Carnap's probability (which is a metalogical concept) and its logico-mathematical framework. First-order theories and their Boolean (or Lindenbaum–Tarski) algebras are defined. The chapter defines probabilities on sentences (relative to a theory, i.e., logical probabilities) and on Boolean algebras (of sets) following Kolmogorov, and discusses their mutual relationship. The concepts of sigma algebra, compact algebra, compact theory, and disintegrable probability are introduced, and their interrelationships are discussed. Conditional probability is examined. The chapter concludes with an investigation of embedded (or iterated) probability.

Chapter 1, *Classical thought and its transformations*, and Chapter 2, *Positivism and subjectivism*, the author says are "an attempt to understand the roots of Carnapian logical probability in a classical (mostly Humean) theory of ideas and judgements" (p. 7). The transformation of thought is traced through the examination of the development and interaction of logicism, psychologism, empiricism, subjectivism, and positivism. Besides Hume, the author discusses Leibniz, Kant, Frege, Tarski, Carnap, Quine, and de Finetti.

The most important transformations noted by the author are the following: (1) a problem shift from "the nature of probability" to "the consistency of probabilistic judgement"; (2) the development of the axiomatic approach making it possible to deal with probability axiomatically; (3) on the epistemological level, the distinction between the logical and psychological accounts of probability; (4) the creation of the proposition as an object of judgment not dependent upon an act of judgment, and the shift to language rather than thought or judgment as the field of logical relations; and (5) the distinction between meta-language and object language.

Chapter 4, *Probability quantifiers: fundamentals*, and Chapter 5, *Probability quantifiers: multivariate and conditional quantifiers*, develop Carnap's work. Their central question is that of embedded and conditional probabilities. Unlike Carnap, who deals with embedded probabilities on the level of the meta-meta-language (or higher levels), the author—by introducing probability quantifiers—internalizes the notion of probability. Hence finite hierarchies of embedded probabilities can also be internalized and dealt with on the level of the object language itself. In doing so, the author is following what Frege has done for generality. In his treatment of conditional probability, the author takes it as a basic notion, and not as the quotient of non-conditional probabilities. One advantage of this is that conditional probabilities may be defined in some cases where the antecedent (or the condition) has probability zero.

Comments: Because of space limitations, the following remarks are brief, and confined to the most important points.

I. Let A_1, A_2, \dots be an ascending chain in a (set) Boolean algebra Ω . The element $A \in \Omega$ is a limit (i.e., an upper limit) of this chain if (i) $A_i \subseteq A$ for all i , and (ii) $A \subseteq C$ for all $C \in \Omega$ satisfying (i) (p. 83). Descending chains and their (lower) limits are defined similarly. On pp. 83–84 one reads, "The upper limit of an ascending chain is the union of its members; the lower limit of a descending chain is the
