Auto-immunity in the Endocrine System R.

Volpe,2012-12-06 The present monograph will concern itself with those disorders of the endocrine system either associated with destruction interference with function or hyper function which are considered to be due to auto immune processes Endocrinopathies Non endocrine auto immune disorders associated with the endocrinopathies Graves Basedow s Parry s disease Pernicious anaemia Hashimoto s thyroiditis Vitiligo Idiopathic Addison s disease Myaesthesia gravis Insulinopenic diabetes mellitus Sjogren s syndrome Auto immune oophoritis and orchitis Rheumatoid arthritis Auto immune hypoparathyroidism Idiopathic thrombocytopenic purpura Auto immune hypophysitis Chronic active hepatitis Possibly some cases of infertility Primary biliary cirrhosis due to anti sperm antibodies Reproduced with permission from Volpe 1977 The above table indicates those organ specific endocrinopathies considered to be due to auto immune factors as well as those non endocrine organ specific auto immune disorders which may be associated with them Volpe 1977 It is evident that such disorders occurring without any obvious external cause raise the very elementary question of how immune processes directed against self constituents could be initiated Generally of course the immune system acts as a regulatory and defence mechanism and disorders of auto immunity represent breakdowns in this regulatory system The following chapters will be concerned with the individual components ofthe endocrine system so affected by auto immune processes it will first be necessary to provide an initial chapter for the purpose of summarizing some general principles of immunology in order to place the immune disorders of the endocrine system in context

Exploring autoimmune diseases and endocrine crosstalk Alessandro Antonelli ,Anette S. B. Wolff,Deepika Watts,2025-11-06

The endocrine system is a network of glands that produce and release hormones essential to control and regulate many bodily functions and maintain biological balance Physiological processes including development metabolism reproduction and homeostasis crucially depend on hormones and high vascularization of the endocrine organs ensures communication of hormones with other systems of the body The immune system is highly receptive to endocrine signals which can result in immune suppression or activation depending on the hormone and its action For instance testosterone and estrogen have immunosuppressive and immunoenhancing effects respectively Growth hormones are further known to play a role in immune cell proliferation Glucocorticoids are prescribed for inflammatory and autoimmune diseases due to their immunosuppressive and anti inflammatory effects Autoimmune diseases result from a breakdown of immune balance for example of T effector regulator T cells subsequently destroying cells tissues or organs of the body Therefore immune balance is crucial for the prevention of autoimmune diseases and hormonal balance is essential for overall biological balance Autoimmune diseases are complex and their exact causes are unknown Genetic predisposition and environmental factors are believed to play a role in their development but hormones are also important for maintaining overall biological equilibrium including immune cells Endocrine disrupting chemicals EDCs such as bisphenol A phthalate tetrachlorodibenzodioxin can impact the immune system and are correlated with the development of autoimmune diseases suggesting an ongoing crosstalk between immune and endocrine balance However the role of the endocrine system or EDCs in the development of autoimmune diseases remains ambiguous and needs to be studied further for the development of therapeutic approaches and prevention of autoimmune diseases In certain autoimmune diseases the immune system targets the endocrine organs such as the pancreas adrenal gland and thyroids causing type 1 diabetes Addison s disease and autoimmune thyroid diseases respectively Treatment options mostly include life long hormone replacements which can be stressful and exhausting for the patients This Research Topic aims to improve the understanding of the crosstalk between autoimmune diseases and the endocrine system leading to better prognoses and the development of targeted treatment strategies for these diseases We welcome the submission of articles that cover but not limited to the following sub topics Role of endocrine imbalance in autoimmune diseases Endocrine disrupting chemicals and their impact on the immune system

Endocrine Autoimmune diseases Side effects of hormone treatments in autoimmune diseases Crosstalk of Immune and hormonal balance Suppression of the immune system by hormones Neuroendocrine imbalance in autoimmune diseases
