Automated Theorem Proving In Software Engineering:

Automated Theorem Proving in Software Engineering Johann M. Schumann,2013-06-29 Growing demands for the quality safety and security of software can only be satisfied by the rigorous application of formal methods during software design This book methodically investigates the potential of first order logic automated theorem provers for applications in software engineering Illustrated by complete case studies on protocol verification verification of security protocols and logic based software reuse this book provides techniques for assessing the prover s capabilities and for selecting and developing an appropriate interface architecture

Generating Test Templates Via Automated Theorem Proving National Aeronautics and Space Administration, MANI PRASARD. KANCHERLA, 2025-05-22. Testing can be used during the software development process to maintain fidelity between evolving specifications, program designs, and code implementations. We use a form of specification-based testing that employs the use of an automated theorem prover to generate test templates. A similar approach was developed using a model checker on state-intensive systems. This method applies to systems with functional rather than state-based behaviors. This approach allows for the use of incomplete specifications to aid in generation of tests for potential failure cases. We illustrate the technique on the canonical triangle testing problem and discuss its use on analysis of a spacecraft scheduling system. ACM Transactions on Software Engineering and Methodology, 2003. *Automated Theorem Proving in High-Quality Software Design*. Johann Schumann, Nasa Technical Reports Server (Ntrs), 2013-07. The amount and complexity of software developed during the last few years has increased tremendously. In particular, programs are being used more and more in embedded systems, from car brakes to plant control. Many of these applications are safety-relevant, i.e., a malfunction of hardware or software can cause severe damage or loss. Tremendous risks are typically present in the area of aviation, nuclear power plants, or chemical plant control. Here, even small problems can lead to thousands of casualties and huge financial losses. Large financial risks also exist when computer systems are used in the area of telecommunication, telephone, electronic commerce, or space exploration. Computer applications in this area are not only subject to safety considerations but also security issues are important. All these systems must be designed and developed to guarantee high quality with respect to safety and security. Even in an industrial setting, which is or at least should be aware of the high requirements in Software Engineering, many incidents occur. For example, the Warsaw Airbus crash was caused by

an incomplete requirements specification Uncontrolled reuse of an Ariane 4 software module was the reason for the Ariane 5 disaster Some recent incidents in the telecommunication area like illegal cloning of smart cards of D2GSM handies or the extraction of secret passwords from German T online users show that also in this area serious flaws can happen Due to the inherent complexity of computer systems most authors claim that only a rigorous application of formal methods in all stages of the software life cycle can ensure high quality of the software and lead to real safe and secure systems In this paper we will have a look in how far automated theorem proving can contribute to a more widespread application of formal methods and their tools and what automated theorem provers ATPs must provide in order to be useful
