Automating the Design of Computer Systems William P. Birmingham, Anurag P. Gupta, Daniel P. Siewiorek, 1992-12-18
Addressing the issues of engineering design in computer architecture this book describes the design and implementation of MICON a system for automating the synthesis of small computers

Intelligent Computer Systems in Engineering Design Staffan Sunnersjö, 2016-01-11 This introductory book discusses how to plan and build useful reliable maintainable and cost efficient computer systems for automated engineering design The book takes a user perspective and seeks to bridge the gap between texts on principles of computer science and the user manuals for commercial design automation software The approach taken is top down following the path from definition of the design task and clarification of the relevant design knowledge to the development of an operational system well adapted for its purpose This introductory text for the practicing engineer working in industry covers most vital aspects of planning such a system Experiences from applications of automated design systems in practice are reviewed based on a large number of real industrial cases The principles behind the most popular methods in design automation are presented with sufficient rigour to give the user confidence in applying them on real industrial problems This book is also suited for a half semester course at graduate level and has been complemented by suggestions for student assignments grown out of the lecture notes of two postgraduate courses given annually or biannually during the last ten years at the Product development program at the School of Engineering at Jnk ping University

Automating Systems Development David R. Benyon, Steve Skidmore, 2012-12-06 1 INTRODUCTION These proceedings are the result of a conference on Automating Systems Development held at Leicester Polytechnic England on 14 to 16 April 1987 The conference was attended by over 170 delegates from industry and academia and it represents a comprehensive review of the state of the art of the use of the computer based tools for the analysis design and construction of Information Systems IS Two parallel streams ran throughout the conference The academic or research papers were the fruit of British European and Canadian research with some of the papers reflecting UK Government funded Alvey or European ESPRIT research projects Two important touchstones guided the selection of academic papers Firstly they should be primarily concerned with system rather than program development Secondly they should be easily accessible to delegates and readers We felt that formal mathematical papers had plenty of other opportunities for airing and publication The second stream was the applied programme a set of formal presentations given by leading software vendors and consultancies It is clear that many advances in systems development are actually applied rather than re search led Thus it was important for delegates to hear how leading edge companies view the State of the Art This was supported by a small exhibi tion area where certain vendors demonstrated the software they had intro duced in the formal presentation Towards an Expert System for Automating Digital Circuit Design Stanford University. Automating Quality Systems J.D. Tannock,2012-12-06 Quality is a topical issue in manufacturing Competitive quality performance still eludes many manufacturers in the traditional industrialized countries A lack of quality competitiveness is one of the root causes of the relative industrial decline and consequent trade imbalances which plague some Western economies Many explanations are advanced for poor quality performance Inadequate levels of investment in advanced technology together with insufficient education and training of the workforce are perhaps the most prominent Some believe these problems are caused by a lack of awareness and commitment from top management while others point to differences between industrial cultures The established remedy is known as Total Quality Management TQM TQM requires a corporate culture change driven from the top and involving every employee in a process of never ending quality improvement aimed at internal as well as external customers The techniques deployed to achieve TQM include measures to improve motivation training in problem solving and statistical process control SPC Quality is however only one of the competitive pressures placed It is also upon the manufacturer by the modern global economy imperative to remain economical and efficient while increasing the flexibility and responsiveness of the design and manufacturing functions Here the reduction or elimination of stock is of great importance particularly as financial interest rates in the less successful manufacturing nations are frequently high Product life cycles must become ever more compressed in response to the phenomenal design to manufacture performance of some
