Abstract

An overview is presented about Ball Milling as a tool for generation of non-equilibrium materials. Emphasis is placed on recent experiments demonstrating the competition between thermodynamic and kinetic conditions during the process. Investigations of model systems with different thermodynamic prerequisites under varying milling conditions allow the identification of elementary processes. In systems with tendency for decomposition or ordered systems the possibility of steady states resulting from the competition of thermally activated and mechanically driven processes is discussed.

Introduction

The technique of Mechanical Alloying (MA) was developed by J.S. Benjamin and his coworkers at INCO in the early 70's. The aim was to combine the advantages of precipitation hardening and oxide dispersion strengthening in nickel-base superalloys [1]. As the oxides cannot be dispersed in liquid phase, a solid state processing technique was necessary. Dispersion of oxides in solid state by MA and subsequent densification leads to materials with excellent mechanical properties over a wide range of temperatures.

The applications are focused mainly on oxide dispersion alloys (ODS). One example is sintered aluminum powder, where alumina (Al_2O_3) is incorporated into Al obtaining a strengthening up to the melting point. The first alloy used for high temperatures was Ni with Thorium oxide. For gas turbines "superalloys" are used which consist of NiCr alloy and dispersed oxides (e.g. INCO MA 6000). The powder processing (hot extrusion and rolling) results in elongated grains (e.g. 700x15 μm). Detailed descriptions of applications in several fields may be found in [5].

The MA technique has also been used for the synthesis of equilibrium and non-equilibrium materials [2-6]. This ability has raised broad interest in the method, which may be compared with other nonequilibrium techniques such as rapid quenching from the liquid or vapor phase. In the following sections, a short description will be given of the process parameters and then proceed with reporting observations of the phase formation during MA in systems with positive or negative heat of mixing. Finally, a comparison with the Ball Milling of intermetallic compounds will be made. In these experiments, the generation of defects can be observed without simultaneous mixing of the components. Using both thermodynamic and kinetic arguments, the observations can be explained in a unified picture.
