Leonard Presby,1984 **COMPSTAT** F. de Antoni,N. Lauro,A. Rizzi,2012-12-06 When dealing with the design or with the application of any technical system which is not quite simple and trivial one has to face to the problem to determine the allowable deviations of the system functions and the optimal vector of system parameter tolerances The need for the solution of this problem is stimulated with various serious economic and maintenance aspects between them the tendency to reach the minimal production cost the maximal system operation reliability are the most frequent Suppose that we are dealing with an system S consisting of N components represented by the system parameters x_i $i = 1, 2, \dots, N$ which are arranged in certain structure so that the K system functions F_k $k = 1, 2, \dots, K$ expressing the considered system properties fulfill the condition $F \in F_0$ $A \in A_0$ $F_k \in F_{k0}$ $A_k \in A_{k0}$ where F_0 is the set of the actual system functions F_{k0} is the set of the nominal system functions and A_0 is the set of the allowable deviations The set F depends besides the system structure also on the vector X of the system parameters Suppose that the system structure is invariant *COMPSTAT 1982*. Computational Statistics Yadolah Dodge, Joe Whittaker, 2013-11-11 The Role of the Computer in Statistics David Cox Nuffield College Oxford OX1 1NF U K A classification of statistical problems via their computational demands hinges on four components I the amount and complexity of the data ii the specificity of the objectives of the analysis iii the broad aspects of the approach to analysis iv the conceptual mathematical and numerical analytic complexity of the methods Computational requirements may be limiting in I and iv either through the need for special programming effort or because of the difficulties of initial data management or because of the load of detailed analysis The implications of modern computational developments for statistical work can be illustrated in the context of the study of specific probabilistic models the development of general statistical theory the design of investigations and the analysis of empirical data While simulation is usually likely to be the most sensible way of investigating specific complex stochastic models computerized algebra has an obvious role in the more analytical work It seems likely that statistics and applied probability have made insufficient use of developments in numerical analysis associated more with classical applied mathematics in particular in the solution of large systems of ordinary and partial differential equations integral equations and integro differential equations and for the extraction of useful information from integral transforms Increasing emphasis on models incorporating specific subject matter considerations is one route to bridging the gap between statistical analysis and application
