**Computational Intelligence in Expensive Optimization Problems** Yoel Tenne,Chi-Keong Goh,2010-03-10 In modern science and engineering laboratory experiments are replaced by high fidelity and computationally expensive simulations Using such simulations reduces costs and shortens development times but introduces new challenges to design optimization process Examples of such challenges include limited computational resource for simulation runs complicated response surface of the simulation inputs outputs and etc Under such difficulties classical optimization and analysis methods may perform poorly This motivates the application of computational intelligence methods such as evolutionary algorithms neural networks and fuzzy logic which often perform well in such settings This is the first book to introduce the emerging field of computational intelligence in expensive optimization problems Topics covered include dedicated implementations of evolutionary algorithms

neural networks and fuzzy logic reduction of expensive evaluations modelling variable fidelity fitness inheritance frameworks for optimization model management complexity control model selection parallelization of algorithms implementation issues on clusters grids parallel machines incorporation of expert systems and human system interface single and multiobjective algorithms data mining and statistical analysis analysis of real world cases such as multidisciplinary design optimization The edited book provides both theoretical treatments and real world insights gained by experience all contributed by leading researchers in the respective fields As such it is a comprehensive reference for researchers practitioners and advanced level students interested in both the theory and practice of using computational intelligence for expensive optimization problems

*Approximation Methods for High Dimensional Simulation Results - Parameter Sensitivity Analysis and Propagation of Variations for Process Chains* Daniela Steffes-lai, 2014 This work addresses the analysis of a sequential chain of processing steps which is particularly important for the manufacture of robust product components In each processing step the material properties may have changed and distributions of related characteristics for example strains may become inhomogeneous For this reason the history of the process including design parameter

uncertainties becomes relevant for subsequent processing steps Therefore we have developed a methodology called PRO CHAIN which enables an efficient analysis quantification and propagation of uncertainties for complex process chains locally on the entire mesh This innovative methodology has the objective to improve the overall forecast quality specifically in local regions of interest while minimizing the computational effort of subsequent analysis steps We have demonstrated the benefits and efficiency of the methodology proposed by means of real applications from the automotive industry
