The Voice in the Machine Roberto Pieraccini, 2012 An examination of more than sixty years of successes and failures in developing technologies that allow computers to understand human spoken language Stanley Kubrick's 1968 film 2001 A Space Odyssey famously featured HAL a computer with the ability to hold lengthy conversations with his fellow space travelers More than forty years later we have advanced computer technology that Kubrick never imagined but we do not have computers that talk and understand speech as HAL did Is it a failure of our technology that we have not gotten much further than an automated voice that tells us to say or press 1 Or is there something fundamental in human language and speech that we do not yet understand deeply enough to be able to replicate in a computer In *The Voice in the Machine* Roberto Pieraccini examines six decades of work in science and technology to develop computers that can interact with humans using speech and the industry that has arisen around the quest for these technologies He shows that although the computers today that understand speech may not have HAL's capacity for conversation they have capabilities that make them usable in many applications today and are on a fast track of improvement and innovation Pieraccini describes the evolution of speech recognition and speech understanding processes from waveform methods to artificial intelligence approaches to statistical learning and modeling of human speech based on a rigorous mathematical model specifically Hidden Markov Models HMM He details the development of dialog systems the ability to produce speech and the process of bringing talking machines to the market Finally he asks a question that only the future can answer will we end up with HAL like computers or something completely unexpected

Computer Speech Manfred R. Schroeder, 2013-06-29 Computer Speech is an introduction to multimedia speech applications and is suitable for nonspecialists It treats such contemporary subjects as automatic speech recognition and speaker verification for banking by

Speech Technology at Work Jack Hollingum, Graham Cassford, 2013-01-06 Speech technology the use of speech as a means of sending information to and receiving information from computer systems has been in use as a research tool for many years Only recently has it begun to move out of the laboratory and into commercially worthwhile applications first with compressed and synthesised spoken messages then with computer recognition of spoken messages and today with diverse applications involving both recognition and reproduction of human speech We have written this book because we believe the technology has now advanced to the point where many more applications of voice recognition and response are both feasible and economically attractive Computers that can understand everyday speech are still a distant prospect but provided the limitations of present day equipment are clearly understood there is much that can be achieved with it Our aim is to show in non technical language what is now possible with the help of speech technology The text includes many examples of current applications in industry commerce and other fields and we have selected five current industrial applications combining speech recognition and response for more detailed attention Industrial cases have been chosen both because we see industry as an important growth area for speech applications in the next few years and because it presents some of the greatest difficulties in speech recognition if you can make it work in industry then you can make it work almost anywhere

The Path of Speech Technologies in Computer Assisted Language Learning Melissa Holland, F. Pete Fisher, 2008-02-08 This collection examines the promise and limitations for computer assisted language learning of emerging speech technologies speech recognition text to speech synthesis and acoustic visualization Using pioneering research from contributors based in the US and Europe this volume illustrates the uses of each technology for learning languages the problems entailed in their use and the solutions evolving in both technology and instructional design To illuminate where these technologies stand on the path from research toward practice the book chapters are organized to reflect five stages in the maturation of learning technologies basic research analysis of learners needs adaptation of technologies to meet needs development of prototypes to incorporate adapted technologies and evaluation of prototypes The volume demonstrates the progress in employing each class of speech technology while pointing up the effort that remains for effective reliable application to language learning
