Computer-Aided Mechanical Assembly Planning Luis S. Homem de Mello, Sukhan Lee, 1991-09-30 Some twenty years have elapsed since the first attempts at planning were made by researchers in artificial intelligence These early programs concentrated on the development of plans for the solution of puzzles or toy problems like the rearrangement of stacks of blocks These early programs provided the foundation for the work described in this book the automatic generation of plans for industrial assembly As one reads about the complex and sophisticated planners in the current generation it is important to keep in mind that they are addressing real world problems Although these systems may become the toy systems of tomorrow they are providing a solid foundation for future more general and more advanced planning tools As demonstrated by the papers in this book the field of computer aided mechanical assembly planning is maturing It now may include geometric descriptions of parts extracted from or compatible with CAD programs constraints related to part interference and the use of tools fixtures and jigs required for the assembly the nature of connectors matings and other relations between parts number of turnovers required during the assembly handling and gripping requirements for various parts automatic identification of subassemblies This is not an exhaustive list but it serves to illustrate the complexity of some of the issues which are discussed in this book Such issues must be considered in the design of the modern planners as they produce desirable assembly sequences and precedence relations for assembly

Planning Alain Delchambre,2012-12-06 The assembly sector is one of the least automated in the manufacturing industry Automation is essential if industrial companies are to be competitive in the future In assembly an integrated and flexible approach is needed because 75% of the applications are produced in small and medium batches The methodologies developed in this book deal with the integration of the assembly process from the initial design of the product to its production In such an integrated system assembly planning is one of the most important features A well chosen assembly plan will reduce both the number of tool changes and the fixtures within the assembly cell It will prevent the handling of unstable subassemblies simplify the design of the robot grippers and reduce production costs An automatic generator of assembly sequences can be an efficient aid to the designer Whenever he or she modifies features of the product the influence of these modifications can immediately be checked on the sequences For small batch production the automatic generation of assembly sequences is faster more reliable and more cost effective than manual generation By using this latter method interesting sequences could be missed because of the combinatorial explosion of solutions The main subjects treated in this book are as follows 1 Presentation and classification of existing systems of automatic generation of assembly sequences Automatic assembly planning is indeed a very recent research area and in my experience no systematic study has been carried out up to now

Delchambre,2011-06-28 *Integrated Design of a Product Family and Its Assembly System* presents an integrated approach for the design of a product family and its assembly system whose main principles consider the product family as a fictitious unique product for which the assembly system is to be devised It imposes assembly and operation constraints as late as possible in the design process to get liberties in the system design and adapts the product family at each design stage to integrate the new constraints related to the successive design choices *Integrated Design of a Product Family and Its Assembly System* is an important must have book for researchers and Ph D students in Computer Integrated Manufacturing

Graphics and Robotics Wolfgang Straßer, Friedrich M. Wahl, 2012-12-06 Problems common to graphics and robotics are covered in this reviewed selection of papers written following a 1993 workshop. Leading experts from both disciplines met to identify common problems to present new solutions and to discuss future research directions. Topics covered include robot simulation using graphics workstations, simulation concepts in the framework of teleoperation, path planning strategies, collision detection techniques, experimentation using virtual reality, modeling techniques for automated programming and for objects with curved surfaces, object oriented implementations, various aspects of robot vision and in a paper that reflects the essence of the workshop, the challenging task of designing a vision system for a domestic robot. *Computer-Aided Assembly Planning* Alain Delchambre, 1992-09-30 **Proceedings**, 2005 **Intelligent Assembly and Disassembly** Peter Kopacek, Dragica Noe, 1998 Paperback. Rapid development observed in modern production is firmly connected with the development of new assembly and disassembly systems. In small batch production where fast changes of products and short development times of new products are demanded, development of reliable, fast, adaptable and self-teaching assembly systems can be observed. Important fields of product development such as product design, development of planning systems, simulation and modelling, logistics, mechatronics and sensors, development of new assembly system components as well as collecting and processing of knowledge are essential for the development of new intelligent assembly systems (IAS). The aim of this colloquium, specialised on IAD, is to highlight this topic, show the actual results of the research and development work, set the direction of future development and analyse the possibilities of introducing IAD into the production process.
