Arsenic In Drinking Water:

Arsenic and Drinking Water, 2021 **Arsenic in Drinking Water** National Research Council, Division on Earth and Life Studies, Commission on Life Sciences, Subcommittee on Arsenic in Drinking Water, 1999-07-14 The U S Environmental Protection Agency EPA has been considering a more stringent regulation of arsenic in water A significant reduction in the maximum contaminant level MCL could increase compliance costs for water utilities This book discusses the adequacy of the current EPA MCL for protecting human health in the context of stated EPA policy and provides an unbiased scientific basis for deriving the arsenic standard for drinking water and surface water Arsenic in Drinking Water evaluates epidemiological data on the carcinogenic and noncarcinogenic health effects of arsenic exposure of Taiwanese populations and compares those effects with the effects of arsenic exposure demonstrated in other countries including the United States The book also reviews data on toxicokinetics metabolism and mechanism and mode of action of arsenic to ascertain how these data could assist in assessing human health risks from arsenic exposures This volume recommends specific changes to improve the toxicity analyses and risk characterization The implications of the changes for EPA s current MCL for arsenic are also described **Arsenic in Drinking Water** Canada. Health Canada, 1999 Arsenic in Drinking Water United States. Congress. House. Committee on Science. Subcommittee on Environment, Technology, and Standards, 2001 **Arsenic** Bryan Black, 1999 The recently lowered arsenic maximum contaminant level MCL presents new challenges in the monitoring and treatment capabilities of drinking water utilities This report provides advice to utilities and consultants as they monitor make treatment modifications to control arsenic and explain arsenic issues to the public It overviews research on arsenic in drinking water with respect to health issues occurrence monitoring and treatment and reviews the major treatment processes coagulation lime softening iron manganese removal ion exchange activated alumina reverse osmosis nanofiltration and augmented micro or ultrafiltration No index Member price 85 Annotation c Book News Inc Portland OR booknews com

Arsenic in Drinking Water National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Committee on Toxicology, Subcommittee to Update the 1999 Arsenic in Drinking Water Report, 2001-11-26 Having safe drinking water is important to all Americans The Environmental Protection Agency s decision in the summer of 2001 to delay implementing a new more stringent standard for the maximum allowable level for arsenic in drinking water generated a great deal of criticism and controversy Ultimately at issue were newer data on arsenic beyond those that had been examined in a 1999 National Research Council report EPA asked the National Research Council for an evaluation of the new data available The committee s analyses and conclusions are presented in Arsenic in Drinking Water 2001 Update New epidemiological studies are critically evaluated as are new experimental data that provide information on how and at what level arsenic in drinking water can lead to cancer The report s findings are consistent with those of the 1999 report that found high risks of cancer at the previous federal standard of 50 parts per billion In fact the new report concludes that men

and women who consume water containing 3 parts per billion of arsenic daily have about a 1 in 1 000 increased risk of developing bladder or lung cancer during their lifetime *Arsenic in Drinking Water*, 1991 [Arsenic in Drinking Water](#), 1991 *Arsenic in Drinking Water and Food* Sudhakar Srivastava, 2019-08-08 Arsenic contamination poses a major environmental problem especially in Southeast Asian countries like Bangladesh and India Threatening the health of millions of people due to arsenic's toxicity and carcinogenicity the major routes of arsenic exposure for humans are either through drinking water or crops Rice is the crop most affected by arsenic owing to its cultivation in major arsenic contaminated areas biogeochemical factors in the soil during rice growth and specific features of rice that enable it take up more arsenic than other crop plants This book addresses the problem of arsenic by pursuing a holistic approach It presents the status quo in different parts of the world North and South America Europe Asia etc and provides essential information on food related arsenic exposure risks for humans and possible preventive and curative measures for tackling arsenic poisoning It covers the arsenic contamination status of rice rice based products other vegetables fishes mushrooms and other foods with a special focus on rice arsenic interactions The mechanisms of arsenic uptake translocation and distribution in plants and grains are also explained In closing the book reviews a variety of prospective agronomic and biotechnological solutions to the problem of arsenic accumulation in rice grains The book is intended for a broad audience including researchers scientists and readers with diverse backgrounds including agriculture environmental science food science environmental management and human health It can also be used as an important reference guide for undergraduate and graduate students university faculties and environmentalists **Arsenic in Drinking Water** National Research Council (U.S.). Subcommittee on Arsenic in Drinking Water, 2001 **Technical Fact Sheet** John B. Bennett, Gerald D. Stedje, United States. Environmental Protection Agency. Office of Water, 2001 *Arsenic in Drinking Water* John Kasprak, 2001 Discusses the state's allowable level of arsenic in drinking water [Cancer Risks Associated With Elevated Levels of Drinking Water Arsenic Exposure](#) F. J. Frost, 2005-07-31 In 2000 the USEPA reduced the drinking water arsenic MCL from 50 g/L to 10 g/L affecting many U.S. community water systems This study was conducted because of the large number of systems involved the costs of compliance with the new standard and the increasingly uncertain scientific basis for the regulation Two large recently conducted studies of low dose drinking water arsenic exposures do not support the need for the regulation The objective of this project was to examine whether lung and bladder cancer mortality or incidence rates are elevated in U.S. populations consuming drinking water that exceeds the new USEPA MCL for arsenic of 10 g/L This study took place in two phases In the first phase the research team estimated the mean drinking water arsenic level of most U.S. counties and identified counties with a mean arsenic level 10 g/L and 20 g/L In the second phase they evaluated the relationships between lung and bladder cancer mortality 1950-1999 and incidence 1973-1999 in these populations using multi-level hierarchical statistical models i.e. MLwiN statistical software The research team employed three approaches 1 combining all cancer deaths for all ages across the decades 1950-1990 for which

data were available 2 conducting a subanalysis limited to the population age 50 years and older and 3 combining cancer deaths for those decades 1960 1999 for which comparable census variables were available Arsenic in drinking water at levels 10 g L was not associated with greater mortality from bladder or lung cancer nor was a higher level of arsenic associated with greater incidence of bladder or lung cancer There was considerable variation between counties in both lung and bladder cancer mortality County lung and bladder cancer mortality rates were strongly related to neighboring county lung and bladder cancer mortality rates This relation suggests that making an adjustment for neighboring county cancer mortality rates controls the unmeasured confounding factors Higher mortality rates for bladder and lung cancer were observed in counties designated as metropolitan and for males counties with a high percentage of persons employed in manufacturing Lower mortality rates were observed in counties with higher mean educational levels and counties with a larger mean household size These same covariate relationships were not apparent in the incidence analysis This study did not find evidence of increased risk for lung or bladder cancer mortality or incidence from exposure to arsenic in drinking water The findings are consistent with other recent studies of the health effects of low dose arsenic exposure and are inconsistent with the USEPA predictions of excess cancer risk from low dose arsenic exposure Multi level hierarchical analysis is a highly appropriate method for determining if areas with elevated drinking water contaminants have elevated health risks It makes optimal use of existing data in a cost effective analysis that adjusts for many covariates It is an approach that should be considered for addressing future drinking water health effects issues In particular this study adds to the literature on low dose arsenic health effects providing the first summary of mortality and cancer incidence in U S populations exposed to elevated drinking water arsenic It should provide some reassurance to customers of many drinking water utilities Originally published by AwwaRF for its subscribers in 2004 This publication can also be purchased and downloaded via Pay Per View on Water Intelligence Online click on the Pay Per View icon below
