

Ex. 2) A friend invites you to play the following game: 2 coins are to be selected at random from 6 coins: 2 nickels, 3 dimes, 1 quarter. If the sum of the values of the coins is 10, 20, or 30 cents, your friend pays you 25 cents. Otherwise, you must pay your friend the value of the coins. What is your expected gain per play of the game?

$$NN = 10$$

$$ND = 15$$

$$DD = 20$$

$$NQ = 30$$

$$DQ = 35$$

Value of X

$$-35$$

$$-15$$

$$+25$$

$P_r[X]$

$$\frac{C(3,0) \cdot C(1,1)}{C(6,2)} = \frac{3}{15}$$

$$\frac{C(2,1) \cdot C(3,1)}{C(6,2)} = \frac{6}{15}$$

$$\frac{C(2,2)}{C(6,2)} + \frac{C(3,2)}{C(6,2)} + \frac{C(2,1) \cdot C(1,1)}{C(6,2)} = \frac{6}{15}$$

$$E[X] = -35 \cdot \frac{3}{15} + -15 \cdot \frac{6}{15} + 25 \cdot \frac{6}{15} = \boxed{-3}$$

*The Calculus of Complex Functions* William Johnston, 2022-04-01 The book introduces complex analysis as a natural extension of the calculus of real valued functions The mechanism for doing so is the extension theorem which states that any real analytic function extends to an analytic function defined in a region of the complex plane The connection to real functions and calculus is then natural The introduction to analytic functions feels intuitive and their fundamental properties are covered quickly As a result the book allows a surprisingly large coverage of the classical analysis topics of analytic and meromorphic functions harmonic functions contour integrals and series representations conformal maps and the Dirichlet problem It also introduces several more advanced notions including the Riemann hypothesis and operator theory in a manner accessible to undergraduates The last chapter describes bounded linear operators on Hilbert and Banach spaces including the spectral theory of compact operators in a way that also provides an excellent review of important topics in linear algebra and provides a pathway to undergraduate research topics in analysis The book allows flexible use in a single semester full year or capstone course in complex analysis Prerequisites can range from only multivariate calculus to a transition course or to linear algebra or real analysis There are over one thousand exercises of a variety of types and levels Every chapter contains an essay describing a part of the history of the subject and at least one connected collection of exercises that together comprise a project level exploration

**Classification of Musical Objects for Analysis and Composition** Linshujie Zheng, Guerino Mazzola, 2023-05-30 This book presents and discusses the fundamental topic of classification of musical objects such as chords motifs and gestures Their classification deals with the exhibition of isomorphism classes Our structure types include local and global constructions the latter being similar to global structures in geometry such as differentiable manifolds The discussion extends to the role which classification plays for the creative construction of musical compositions Our examples include references to classical compositions such as Beethoven's sonatas and some of the author's own compositions of classical and jazz styles We also discuss software that enables the application of classification to musical creativity The volume is addressed to an audience that would apply classification to programming and creative musical construction
