Distributed Software Engineering:

Distributed Systems Albert Fleischmann, 2012-12-06 The purpose of this book is to make the reader familiar with software engineering for distributed systems Software engineering is a valuable discipline in the development of software The reader has surely heard of software systems completed months or years later than scheduled with huge cost overruns systems which on completion did not provide the performance promised and systems so catastrophic that they had to be abandoned without ever doing any useful work Software engineering is the discipline of creating and maintaining software when used in conjunction with more general methods for effective management its use does reduce the incidence of horrors mentioned above The book gives a good impression of software engineering particularly for distributed systems It emphasises the relationship between software life cycles methods tools and project management and how these constitute the framework of an open software engineering environment especially in the development of distributed software systems There is no closed software engineering environment which can encompass the full range of software missions just as no single flight plan airplane or pilot can perform all aviation missions There are some common activities in software engineering which must be addressed independent of the applied life cycle or methodology Different life cycles methods related tools and project management approaches should fit in such a software engineering framework Tutorial Sol M. Shatz, Jia-Ping Wang, IEEE Computer Society, 1989 **Tools and Environments for Parallel and Distributed Systems** Amr Zaky, Ted Lewis, 2012-12-06

Developing correct and efficient software is far more complex for parallel and distributed systems than it is for sequential processors Some of the reasons for this added complexity are the lack of a universally acceptable parallel and distributed programming paradigm the criticality of achieving high performance and the difficulty of writing correct parallel and distributed programs These factors collectively influence the current status of parallel and distributed software development tools efforts Tools and Environments for Parallel and Distributed Systems addresses the above issues by describing working tools and environments and gives a solid overview of some of the fundamental research being done worldwide Topics covered in this collection are mainstream program development tools performance prediction tools and studies debugging tools and research and nontraditional tools Audience Suitable as a secondary text for graduate level courses in software engineering and parallel and distributed systems and as a reference for researchers and practitioners in industry *Making Globally Distributed Software Development a Success Story* Qing Wang, Dietmar Pfahl, David Raffo, 2008-05-06 This volume contains papers presented at the International Conference on Software Process ICSP 2008 held in Leipzig Germany during May 10-11 2008 ICSP 2008 was the second conference of the ICSP series The theme of ICSP 2008 was Making Globally Distributed Software Development a Success Story Software developers work in a dynamic context of frequently changing technologies and with limited resources Globally distributed development teams are under ever increasing pressure to deliver their products more quickly and with higher levels of quality At the same time global competition is forcing software development

organizations to cut costs by rationalizing processes outsourcing part of or all development activities reusing existing software in new or modified applications and evolving existing systems to meet new needs while still minimizing the risk of projects failing to deliver To address these difficulties new and modified processes are emerging including agile methods and plan based product line development Open Source COTS and community developed software are becoming more and more popular Outsourcing coupled with 24 7 development demands well defined processes to support the coordination of organizationally and geographically separated teams The accepted papers present completed research or advanced work in progress in all areas of software and systems development process including agile software processes CMMI novel techniques for software process representation and analysis process tools and metrics and the simulation and modeling of software processes Contributions reflecting real world experience or derived directly from industrial or open source software development and evolution were particularly welcome

Light-weight Experience Collection in Distributed Software Engineering Anna Averbakh,2015

Nowadays distributed software development has become more common In a distributed project setting managing experience is even more crucial than in a co located project Problems like ineffective communication lack of awareness and trust and restrictive information flow policies impede experience exchange and raise the overall effort for software engineers to collaborate Moreover sharing experiences is usually not part of the development process and considered additional effort This often leads to failure of the experience management initiative due to a lack of participation This thesis proposes a framework for qualitative and quantitative assessment of light weight experience collection Light weight methods primarily aim at lowering the perceived effort and return a reasonable benefit to the experience bearers This thesis proposes characterizing criteria of light weight experience collection and a measurement system to measure gradations of expected effort and benefit of an experience collection method To support knowledge managers in choosing the appropriate collection method this thesis provides a catalogue of strategies from different categories and areas of application in distributed development projects
