Distributed Fuzzy Control Of Multivariable Systems:

Distributed Fuzzy Control of Multivariable Systems Alexander Gegov, 2013-04-17 It is known that many control processes are characterized by both quantitative and qualitative complexity. The quantitative complexity is usually expressed in a large number of state variables respectively high dimensional mathematical model. The qualitative complexity is usually associated with uncertain behaviour respectively approximately known mathematical model. If the above two aspects of complexity are considered separately the corresponding control problem can be easily solved. On one hand large scale systems theory has existed for more than 20 years and has proved its capabilities in solving high dimensional control problems on the basis of decomposition hierarchy decentralization and multilayers. On the other hand the fuzzy linguistic approach is almost at the same age and has shown its advantages in solving approximately formulated control problems on the basis of linguistic reasoning and logical inference. However if both aspects of complexity are considered together the corresponding control problem becomes non trivial and does not have an easy solution. Modern control theory and practice have reacted accordingly to the above mentioned new challenges of the day by utilizing the latest achievements in computer technology and artificial intelligence distributed computation and intelligent operation. In this respect a new field has emerged in the last decade called Distributed intelligent control systems. However the majority of the familiar works in this field are still either on an empirical or on a conceptual level and this is a significant drawback.

Intelligent Systems Yung C. Shin, Chengying Xu, 2017-12-19 Providing a thorough introduction to the field of soft computing techniques. *Intelligent Systems Modeling Optimization and Control* covers every major technique in artificial intelligence in a clear and practical style. This book highlights current research and applications addresses issues encountered in the development of applied systems and describes a wide range of intelligent systems techniques including neural networks fuzzy logic evolutionary strategy and genetic algorithms. The book demonstrates concepts through simulation examples and practical experimental results. Case studies are also presented from each field to facilitate understanding.

Algorithms and Architectures for Real-time Control, AARTC '95 Peter J. Fleming, L. Boullart, 1995 Paperback. The 3rd IFAC IFIP Workshop on Algorithms and Architectures for Real Time Control is concerned with new architectural software and hardware aspects for real time control. This the latest in the series investigates the state of the art and present new research and application results in software and hardware for real time control. The workshop brings together leading engineers and computer scientists who are researchers developers and practitioners both from the academic and industrial world to discuss recent developments.

Intelligent Automatic Generation Control Hassan Bevrani, Takashi Hiyama, 2017-12-19 Automatic generation control AGC is one of the most important control problems in the design and operation of interconnected power systems. Its significance continues to grow as a result of several factors the changing structure and increasing size complexity and functionality of power systems the rapid emergence and uncertainty of renewable energy sources developments in power generation.

consumption technologies and environmental constraints Delving into the fundamentals of power system AGC Intelligent Automatic Generation Control explores ways to make the infrastructures of tomorrow smarter and more flexible These frameworks must be able to handle complex multi objective regulation optimization problems and they must be highly diversified in terms of policies control strategies and wide distribution in demand and supply sources all via an intelligent scheme The core of such intelligent systems should be based on efficient adaptable algorithms advanced information technology and fast communication devices to ensure that the AGC systems can maintain generation load balance following serious disturbances This book addresses several new schemes using intelligent control techniques for simultaneous minimization of system frequency deviation and tie line power changes which is required for successful operation of interconnected power systems It also concentrates on physical and engineering aspects and examines several developed control strategies using real time simulations This reference will prove useful for engineers and operators in power system planning and operation as well as academic researchers and students in field of electrical engineering Frontiers in Advanced Control Systems Ginalber Luiz Serra,2012-07-25 This book pretends to bring the state of art research results on advanced control from both the theoretical and practical perspectives The fundamental and advanced research results as well as the contributions in terms of the technical evolution of control theory are of particular interest This book can serve as a bridge between people who are working on the theoretical and practical research on control theory and facilitate the proposal of development of new control techniques and its applications In addition this book presents educational importance to help students and researchers to know the frontiers of the control technology

Robust Power System Frequency Control Hassan Bevrani,2008-12-19 Frequency control as a major function of automatic generation control is one of the important control problems in electric power system design and operation and is becoming more signi cant today because of the increasing size changing structure emerging new uncertainties environmental constraints and the complexity of power systems In the last two decades many studies have focused on damping control and vo age stability and the related issues but there has been much less work on the power system frequency control analysis and synthesis While some aspects of frequency control have been illustrated along with individual chapters many conferences and technical papers a comprehensive and sensible practical explanation of robust f quency control in a book form is necessary This book provides a thorough understanding of the basic principles of power system frequency behaviour in wide range of operating conditions It uses simple frequency response models control structures andmathematical algorithms to adapt modern robust control theorems with frequency control issue and conceptual exp nations Most developed control strategies are examined by real time simulations Practical methods for computer analysis and design are emphasized This book emphasizes the physical and engineering aspects of the power s tem frequency control design problem providing a conceptual understanding of frequency regulation and application of robust control techniques The main aim is to develop an appropriate intuition relative to the

robust load frequency regulation problem in real world power systems rather than to describe sophisticated mathematical analytical methods

Artificial Intelligence in Real-Time Control 1998 Y.H. Pao, S.R. LeClair, 1999-11-26 This symposium was the seventh in a very successful series in this field Since the beginning of the series there have been a number of very positive developments in the topical area of Intelligent Control In particular the area referred to as situated control has stimulated the formation of new perspectives towards real time intelligent systems The performances of such artificial species as walking cockroaches maze negotiating mice coke can collecting robots and the like have encouraged the exploration of yet more adaptive control perspectives In this symposium there was a strong wind of change bringing more consideration of the roles of learning evolution hybrid systems and so on under many diverse labels and for many different systems and circumstances

Soft Computing Techniques and Applications Robert John, 2000-01-24 The book is a collection of papers presented in the United Kingdom at an international two day workshop on Soft Computing held at the De Montfort University It consists of 38 papers representing the current interests in the fields of fuzzy logic artificial neural networks and genetic algorithms In particular there is a strong emphasis on the use of these techniques for applications that tackle real problems faced in industry The strength of the work is that it is a snapshot of current important research interests in these areas both from a research and application point of view It will be of interest to researchers both academic and from industry as well as post graduate students who wish to see some of the more recent developments in the soft computing field
