The Role of Synaptic Tagging and Capture for Memory Dynamics in Spiking Neural Networks Jannik Luboeinski,2021-09-02 Memory serves to process and store information about experiences such that this information can be used in future situations The transfer from transient storage into long term memory which retains information for hours days and even years is called consolidation In brains information is primarily stored via alteration of synapses so called synaptic plasticity While these changes are at first in a transient early phase they can be transferred to a late phase meaning that they become stabilized over the course of several hours This stabilization has been explained by so called synaptic tagging and capture STC mechanisms To store and recall memory representations emergent dynamics arise from the synaptic structure of recurrent networks of neurons This happens through so called cell assemblies which feature particularly strong synapses It has been proposed that the stabilization of such cell assemblies by STC corresponds to so called synaptic consolidation which is observed in humans and other animals in the first hours after acquiring a new memory The exact connection between the physiological mechanisms of STC and memory consolidation remains however unclear It is equally unknown which influence STC mechanisms exert on further cognitive functions that guide behavior On timescales of minutes to hours that means the timescales of STC such functions include memory improvement modification of memories interference and enhancement of similar memories and transient priming of certain memories Thus diverse memory dynamics may be linked to STC which can be investigated by employing theoretical methods based on experimental data from the neuronal and the behavioral level In this thesis we present a theoretical model of STC based memory consolidation in recurrent networks of spiking neurons which are particularly suited to reproduce biologically realistic dynamics Furthermore we combine the STC mechanisms with calcium dynamics which have been found to guide the major processes of early phase synaptic plasticity in vivo In three included research articles as well as additional sections we develop this model and investigate how it can account for a variety of behavioral effects We find that the model enables the robust implementation of the cognitive memory functions mentioned above The main steps to this are 1 demonstrating the formation consolidation and improvement of memories represented by cell assemblies 2 showing that neuromodulator dependent STC can retroactively control whether information is stored in a temporal or rate based neural code and 3 examining interaction of multiple cell assemblies with transient and attractor

dynamics in different organizational paradigms In summary we demonstrate several ways by which STC controls the late phase synaptic structure of cell assemblies Linking these structures to functional dynamics we show that our STC based model implements functionality that can be related to long term memory Thereby we provide a basis for the mechanistic explanation of various neuropsychological effects Keywords synaptic plasticity synaptic tagging and capture spiking recurrent neural networks memory consolidation long term memory *Roth Memory Course* David Morris Roth,1918
