Carriers And Channels In Biological Systems:

Second International Conference on Carriers and Channels in Biological Systems--Transport Proteins Adil E. Shamoo,1980

Interdisciplinary Conference on Carriers and Channels in Biological Systems Adil E. Shamoo,NEW YORK ACADEMY OF SCIENCES N Y.,1980 Cell membranes have a vital and indispensable function for life processes Membranes endow various cells with their specific function Therefore membranes contain highly specific molecules that can function as carriers pumps channels and receptors These various transport and recognition systems regulate the cell function Thus membranes for example are the site of two most important energy conversion systems in biology photosynthesis and oxidative phosphorylation Photosynthesis represents light conversion into chemical bond energy and oxidative phosphorylation represents nutrient energy conversion into chemical bond energy Thus in the past decades investigators have been pursuing to understand the nature of membrane carriers channels gates and receptors The overall objective of this conference was to assist in defining and search for new ways into the problems associated with the elucidation of the molecular basis of passive and active ion translocation across cellular membranes The conference helped focus the attention into the importance of isolating transport protein carriers and channels from membranous systems Furthermore the conference brought to the attention of the scientific audience at the meeting and at large through the publication of the proceedings the numerous reconstitution procedures recently developed to study more accurately functional aspects of individual proteins Author *Molecular Movements and Chemical Reactivity as Conditioned by Membranes, Enzymes and Other Macromolecules* R. Lefever,A. Goldbeter,2009-09-08 The Advances in Chemical Physics series provides the chemical physics and physical chemistry fields with a forum for critical authoritative evaluations of advances in every area of the discipline Filled with cutting edge research reported in a cohesive manner not found elsewhere in the literature each volume of the Advances in Chemical Physics series serves as the perfect supplement to any advanced graduate class devoted to the study of chemical physics **Membrane Anomalies of Tumor Cells** D. Research ,1986 **Statistical Thermodynamics of Nonequilibrium Processes** Joel Keizer,1987-07-21 The structure of
the theory ofthermodynamics has changed enormously since its inception in the middle of the nineteenth century Shortly
after Thomson and Clausius enunciated their versions of the Second Law Clausius Maxwell and Boltzmann began actively
pursuing the molecular basis of thermo dynamics work that culminated in the Boltzmann equation and the theory of
transport processes in dilute gases Much later Onsager undertook the elucidation of the symmetry oftransport coefficients
and thereby established himself as the father of the theory of nonequilibrium thermodynamics Com bining the statistical
ideas of Gibbs and Langevin with the phenomenological transport equations Onsager and others went on to develop a
consistent statistical theory of irreversible processes The power of that theory is in its ability to relate measurable quantities
such as transport coefficients and thermodynamic derivatives to the results of experimental measurements As powerful as
that theory is it is linear and limited in validity to a neighborhood of equilibrium In recent years it has been possible to extend
the statistical theory of nonequilibrium processes to include nonlinear effects The modern theory as expounded in this book
is applicable to a wide variety of systems both close to and far from equilibrium The theory is based on the notion of
elementary molecular processes which manifest themselves as random changes in the extensive variables characterizing a
system The theory has a hierarchical character and thus can be applied at various levels of molecular detail **National**
