Close To Extinction:

Reduced Kinetic Mechanisms for Applications in Combustion Systems Norbert Peters, Bernd Rogg, 2008-09-11 In general combustion is a spatially three dimensional highly complex physico chemical process of transient nature Models are therefore needed that simulate to such a degree that it becomes amenable to simplify a given combustion problem to theoretical or numerical analysis but that are not so restrictive as to distort the underlying physics or chemistry In particular in view of worldwide efforts to conserve energy and to control pollutant formation models of combustion chemistry are needed that are sufficiently accurate to allow confident predictions of flame structures Reduced kinetic mechanisms which are the topic of the present book represent such combustion chemistry models Historically combustion chemistry was first described as a global one step reaction in which fuel and oxidizer react to form a single product Even when detailed mechanisms of elementary reactions became available empirical one step kinetic approximations were needed in order to make problems amenable to theoretical analysis This situation began to change in the early 1970s when computing facilities became more powerful and more widely available thereby facilitating numerical analysis of relatively simple combustion problems typically steady one dimensional flames with moderately detailed mechanisms of elementary reactions However even on the fastest and most powerful computers available today numerical simulations of say laminar steady three dimensional reacting flows with reasonably detailed and hence realistic kinetic mechanisms of elementary reactions are not possible

Oceanic Migration Charles E.M. Pearce, F. M. Pearce, 2010-06-17 Oceanic Migration studies the prehistoric peopling of the Pacific It uses science and mathematics to expand the research base of Pacific prehistory and casts new light on this final human expansion It explores the fundamental roles of oceanography and of global climate change in determining the paths sequence timing and range of Spice Island based maritime migrations ranging across a quarter of the globe The book is of interest to Pacific prehistorians oceanographers and American anthropologists concerned with the diffusionist debate For oceanographers it presents the new idea of the role of the West Pacific Warm Pool and of three of its four major currents in determining the evolution of voyaging in two oceans For diffusionists it provides new chronological and technological contexts in which the issue of diffusionism needs to be reconsidered For prehistorians it creates a paradigmatic shift by establishing a new time depth and mechanism for Polynesian exploration offers a new view of voyaging and exploration strategies and of economic imperatives and adds a new dimension to the debate on Polynesian origins
