

Cloning Stem Cells: How to Grow Spare Parts

In the laboratory, scientists have cloned stem cells from human skin and egg cells. This is significant because the process could eventually be used to produce organs or other parts that are genetically identical to the patient's own, and therefore, pose no risk of rejection when transplanted.

What is a stem cell?

Stem cells are primitive, unspecialized cells. A 5-day-old human embryo contains an inner cell mass composed of about 12 **embryonic stem cells**.

Adult human bodies contain relatively few stem cells, mostly concentrated in the bone marrow.

Stem cells' value to researchers is that they can be induced into becoming specific tissue or organ cells.

How does cloning produce stem cells?

A patient's body cell is combined with an egg cell and induced to grow into a blastocyst. The blastocyst, or embryo, contains stem cells that can be extracted and grown into any desired type of cell.
