Differential Equations Geometric Theory:

Differential Equations Solomon Lefschetz, 1977 Differential Equations S. Lefschetz, 1973 *Differential Equations* Jean Louis Steinberg, 1963 *Differential Equations*, 1962 Differential Equations: Geometric Theory. Second Edition Solomon LEFSCHETZ, 1963 **The Geometric Theory of Ordinary Differential Equations and Algebraic Functions** Georges Valiron, 1984 *Pure and applied mathematics* Solomon Lefschetz, 1962 **Geometric Theory of Singular Phenomena in Partial Differential Equations** Jean Pierre Bourguignon, Paolo de Bartolomeis, Mariano Giaquinta, 1998-05-28 Featuring contributions from a group of outstanding mathematicians this book covers the most recent advances in the geometric theory of singular phenomena of partial differential equations occurring in real and complex differential geometry Gathering together papers from a workshop held in Cortona Italy this volume will be of great interest to all those whose research interests lie in real and complex differential geometry partial differential equations and gauge theory **Geometric Theory of Differential Equations in the Complex Domain**, 1976 **Differential Equations** Solomon Lefschetz, 1957 **Geometric Theory of Differential Equations in the Complex Domain** R. Gerard, 1975 *Geometric and Algebraic Structures in Differential Equations* P.H. Kersten, I.S. Krasil'shchik, 2012-12-06 The geometrical theory of nonlinear differential equations originates from classical works by S Lie and A B cklund It obtained a new impulse in the sixties when the complete integrability of the Korteweg de Vries equation was found and it became clear that some basic and quite general geometrical and algebraic structures govern this property of integrability Nowadays the geometrical and algebraic approach to partial differential equations constitutes a special branch of modern mathematics In 1993 a workshop on algebra and geometry of differential equations took place at the University of Twente The Netherlands where the state of the art of the main problems was fixed This book contains a collection of invited lectures presented at this workshop The material presented is of interest to those who work in pure and applied mathematics and especially in mathematical physics Differential Equations: Geometric Theory Solomon Lefschetz, 1963 **Geometric Theory of Generalized Functions with Applications to General Relativity** Michael Grosser, 2001-11-30 This work provides the first comprehensive introduction to the nonlinear theory of generalized functions in the sense of Colombeau's construction on differentiable manifolds Particular emphasis is laid on a diffeomorphism invariant geometric approach to embedding the space of Schwartz distributions into algebras of generalized functions The foundations of a nonlinear distributional geometry are developed supplying a solid base for an increasing number of applications of algebras of generalized functions to questions of a primarily geometric nature in particular in mathematical physics Applications of the resulting theory to symmetry group analysis of differential equations and the theory of general relativity are presented in separate chapters These features distinguish the present volume from earlier introductory texts and monographs on the subject Audience The book will be of interest to graduate students as well as to researchers in functional analysis partial differential equations

differential geometry and mathematical physics **The Geometric Theory of Non-linear Differential Equations, Bäcklund Transformation, and Solitons** R. Hermann,1976 **Geometric Theory of Non-Linear Differential Equations, Bäcklund Transformations and Solitons** Robert Hermann,1977 **Global and Geometric Theory of Delay Differential Equations** ,1998 *Geometrical Methods in the Theory of Ordinary Differential Equations* V.I. Arnold,2012-12-06 Since the first edition of this book geometrical methods in the theory of ordinary differential equations have become very popular and some progress has been made partly with the help of computers Much of this progress is represented in this revised expanded edition including such topics as the Feigenbaum universality of period doubling the Zoladec solution the Iljashenko proof the Ecalle and Voronin theory the Varchenko and Hovanski theorems and the Neistadt theory In the selection of material for this book the author explains basic ideas and methods applicable to the study of differential equations Special efforts were made to keep the basic ideas free from excessive technicalities Thus the most fundamental questions are considered in great detail while of the more special and difficult parts of the theory have the character of a survey Consequently the reader needs only a general mathematical knowledge to easily follow this text It is directed to mathematicians aswell as all users of the theory of differential equations **Integrable Mechanical Systems** Róbert Hermann,1984 *Geometric Theory of Discrete Nonautonomous Dynamical Systems* Christian Pötzsche,2010-08-24 Nonautonomous dynamical systems provide a mathematical framework for temporally changing phenomena where the law of evolution varies in time due to seasonal modulation controlling or even random effects Our goal is to provide an approach to the corresponding geometric theory of nonautonomous discrete dynamical systems in infinite dimensional spaces by virtue of 2 parameter semigroups processes These dynamical systems are generated by implicit difference equations which explicitly depend on time Compactness and dissipativity conditions are provided for such problems in order to have attractors using the natural concept of pullback convergence Concerning a necessary linear theory our hyperbolicity concept is based on exponential dichotomies and splittings This concept is in turn used to construct nonautonomous invariant manifolds so called fiber bundles and deduce linearization theorems The results are illustrated using temporal and full discretizations of evolutionary differential equations
