

# The Digestive System

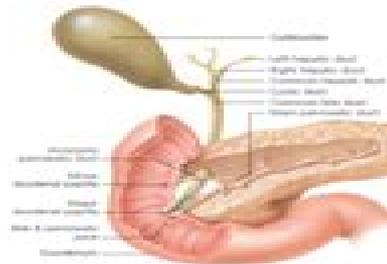

## What is the digestive system?

The digestive system, or gastrointestinal tract, is a complex of organs in which foods, beverages, and other nutrients are broken down, absorbed, and eliminated. The process begins in the mouth, where food is chewed and mixed with saliva. The resulting bolus is then swallowed and moves through the esophagus to the stomach. In the stomach, food is further broken down and mixed with gastric juices. The resulting chyme then moves through the small intestine, where most nutrients are absorbed. The remaining waste then moves through the large intestine, where water is absorbed and the waste is prepared for elimination in the rectum and anal canal.

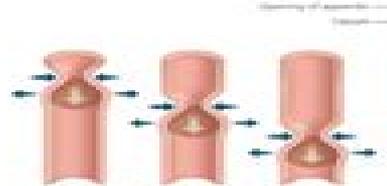

## Liver, pancreas & gallbladder

After leaving the stomach, chyme enters the duodenum, the first part of the small intestine. The duodenum is divided into four parts: the duodenum, jejunum, ileum, and cecum. The duodenum is the only part of the small intestine that is partially in the abdominal cavity. The liver, pancreas, and gallbladder are accessory organs of the digestive system. The liver produces bile, which is stored in the gallbladder. The pancreas produces pancreatic juice, which is secreted into the duodenum.

**Large intestine**  
The large intestine consists of the cecum, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. The large intestine is responsible for the absorption of water and electrolytes from the undigested food. It also produces and stores feces.

**Peristaltic action**  
This involuntary muscular contraction of the digestive system for a definite purpose is called peristalsis. It is the process by which the contents of the digestive tract are moved along. The contraction is caused by the rhythmic contraction of the smooth muscle of the wall.

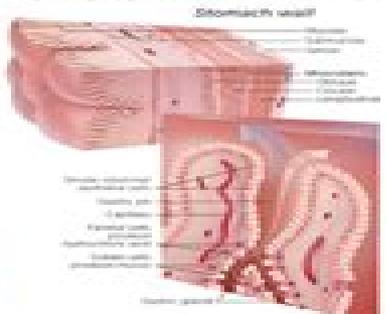

## The mouth & salivary glands

Chewing, the mechanical action of the food, is the first step in the digestion of food. The salivary glands, which are located in the mouth, produce saliva, which is secreted into the mouth. Saliva contains the enzyme amylase, which begins the digestion of starch. The salivary glands also contain mucus, which lubricates the food and helps it to be swallowed.

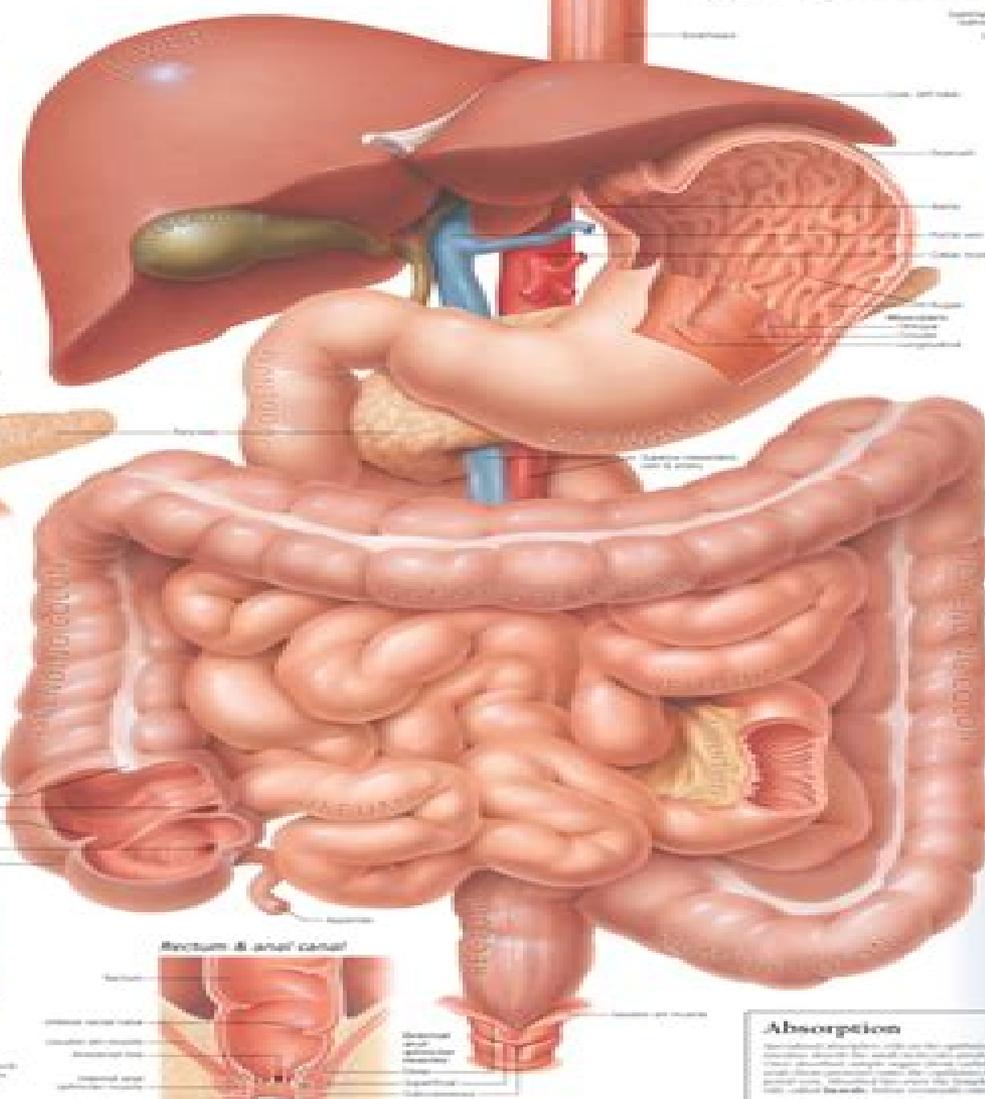

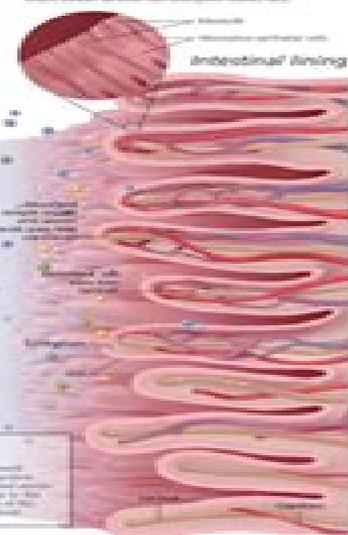

## The stomach

The stomach is a large, muscular organ that is responsible for the digestion of food. It is located in the upper left part of the abdominal cavity. The stomach is divided into two main parts: the fundus and the antrum. The fundus is the upper part of the stomach, and the antrum is the lower part. The stomach is lined with a mucous membrane that secretes gastric juice, which contains the enzyme pepsin. Gastric juice is secreted into the stomach, where it begins the digestion of protein.

## Small intestine

The small intestine is a long, coiled tube that is responsible for the digestion of food. It is located in the central part of the abdominal cavity. The small intestine is divided into three parts: the duodenum, the jejunum, and the ileum. The duodenum is the first part of the small intestine, and the jejunum and ileum are the second and third parts. The small intestine is lined with a mucous membrane that secretes intestinal juice, which contains the enzyme maltase. Intestinal juice is secreted into the small intestine, where it begins the digestion of starch.

**Absorption**  
The process by which nutrients are taken up by the cells of the digestive tract is called absorption. It occurs in the small intestine, where most nutrients are absorbed. The remaining waste then moves through the large intestine, where water is absorbed and the waste is prepared for elimination in the rectum and anal canal.

**The Digestive System** Margaret E. Smith, Dion G. Morton, 2011-11-18 This is an integrated textbook on the digestive system covering the anatomy physiology and biochemistry of the system all presented in a clinically relevant context appropriate for the first two years of the medical student course One of the seven volumes in the Systems of the Body series Concise text covers the core anatomy physiology and biochemistry in an integrated manner as required by system and problem based medical courses The basic science is presented in the clinical context in a way appropriate for the early part of the medical course

The Digestive Tract of Cephalopods: at the Interface Between Physiology and Ecology Giovanna Ponte, Eduardo Almansa, Paul Andrews, 2019-03-25 Aristotle in the *Historia animalium* Book IV gives one of the earliest descriptions of the anatomy of the cephalopod digestive tract comparing it to that of other molluscs From dissections of cuttlefish several key features of the cephalopod digestive tract were described the beak teeth and radula tongue the passage of the oesophagus through the brain en route to the crop and stomach The stomach is described as having spiral convolutions like a trumpet snail shell suggesting that the structure described is actually the caecum The gut then turns anteriorly so that the anal opening is near the funnel leading a modern author to comment that they defaecate on their heads Leroi 2014 In the intervening two millennia research on the cephalopod digestive tract has been sporadic with much of the current knowledge arising from a series of studies in the 1950s to the 1970s by A M Bidder E Boucaud Camou R Boucher Rodoni and K Mangold which established the basic mechanisms of digestion and absorption e g Bidder 1950 Boucaud Camou et al 1976 The last 10 years has seen a resurgence of research on the digestive tract stimulated by interest cephalopods particularly *Octopus vulgaris* and *Sepia officinalis* as candidate species for aquaculture and the potential impact of climate change on cephalopod ecology Additionally the inclusion of cephalopods in the European Union legislation regulating scientific research has necessitated improved understanding of dietary requirements and metabolism as well as the development of methods to monitor digestive tract function to ensure optimal care and welfare in the laboratory Prompted by this resurgence of interest in the cephalopod digestive tract and an international workshop on the topic held in November 2015 we have collected a series of papers reflecting the current state of the art The seventeen papers in this book combine original research publications and reviews covering a diversity of topics that are grouped under four main themes reflecting key topics in the physiology and ecology of the cephalopod digestive tract feeding strategies early life stages and aquaculture anatomy and digestive physiology care and welfare This book provides a timely synthesis of ongoing research into the cephalopod digestive tract which we hope will stimulate further studies into this relatively neglected aspect of cephalopod biology

**Physiology and Pathophysiology of Digestion** D. Neil Granger, James D. Morris, Peter R. Kvietys, 2018-09-13 This collaboration of two physiologists and a gastroenterologist provides medical and graduate students medical and surgical residents and subspecialty fellows a comprehensive summary of digestive system physiology and addresses the pathophysiological processes that underlie some GI diseases The textual approach proceeds by organ instead of the traditional organization followed by other GI textbooks This approach lets the reader track the food bolus as it courses through the GI tract learning on the way each organ's physiologic functions as the bolus directly or indirectly contacts it The book is divided into three parts 1 Chapters 1 3 include coverage of basic concepts that pertain to all or most organs of the digestive system salivation chewing swallowing and esophageal function 2 Chapters 4 6 are focused on the major secretory organs stomach pancreas liver that assist in the assimilation of a meal and 3 Chapters 7 and 8 address the motor transport and digestive functions of the small and large intestines Each chapter includes its own pathophysiology and clinical correlation section that underscores the importance of the organ's normal function Physiology of the Digestive Tract Horace W.
