Differentiation And Integration:

Mathematical Analysis I.G. Aramanovich, R. S. Guter, L.A. Lyusternik, 2014-05-16 Mathematical Analysis Differentiation and Integration is devoted to two basic operations of mathematical analysis differentiation and integration The problems directly connected with the operations of differentiation and integration of functions of one or several variables are discussed together with elementary generalizations of these operations This volume is comprised of seven chapters and begins by considering the differentiation of functions of one variable and of n variables paying particular attention to derivatives and differentials as well as their properties The next chapter deals with composite and implicit functions of n variables in connection with differentiation along with the representation of functions in the form of superpositions Subsequent chapters offer detailed accounts of systems of functions and curvilinear coordinates in a plane and in space the integration of functions and improper integrals The final chapter examines the transformation of differential and integral expressions This book will be a useful resource for mathematicians and mathematics students

[The Fractional Calculus Theory and Applications of Differentiation and Integration to Arbitrary Order](#), 1974-09-05 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering
