## **Advanced Optical Imaging Theory:**

Advanced Optical Imaging Theory Min Gu, 2000 Optical microscopy and associated technologies have advanced rapidly along with laser technology These techniques have stimulated further development of the optical imaging theory including 3 dimensional microscopy imaging theory the theory of imaging with ultrashort pulsed beam illumination and the aberration theory for high numerical aperture objectives This book introduces these new theories in modern optical microscopy providing comparisons with classical imaging as appropriate Advanced Optical Imaging Theory Min Gu, 2013-06-05 Optical microscopy and associated technologies advanced quickly after the introduction of the laser The techniques have stimulated further development of optical imaging theory including 3 dimensional microscopy imaging theory in spatial and frequency domains the theory of imaging with ultrashort pulse beams and aberration theory for high numerical aperture objectives This book introduces these new theories in terms of modern optical microscopy It consists of seven chapters including an introduction The chapters are organized to minimize cross referencing Comparisons with classical imaging theory are made when the new imaging theory is introduced The book is intended for senior undergraduate students in courses on optoelectronics optical engineering photonics biophotonics and applied physics after they have completed modern optics or a similar subject It is also a reference for other scientists interested in the field **High-Aperture Optical Microscopy Methods for Super-Resolution Deep Imaging and Quantitative Phase Imaging** Jeongmin Kim, 2016 Optical microscopy thanks to the noninvasive nature of its measurement takes a crucial role across science and engineering and is particularly important in biological and medical fields To meet ever increasing needs on its capability for advanced scientific research even more diverse microscopic imaging techniques and their upgraded versions have been intensively developed over the past two decades However advanced microscopy development faces major challenges including super resolution beating the diffraction limit imaging penetration depth imaging speed and label free imaging This dissertation aims to study high numerical aperture NA imaging methods proposed to tackle these imaging challenges The dissertation first details advanced optical imaging theory needed to analyze the proposed high NA imaging methods Starting from the classical scalar theory of optical diffraction and partially coherent image formation the rigorous vectorial theory that handles the vector nature of light i e polarization is introduced New sign conventions for polarization ray tracing based on a generalized Jones matrix formalism are established to facilitate the vectorial light propagation with physically consistent outcomes The first high NA microscopic imaging of interest is wide field oblique plane microscopy OPM for high speed deep imaging It is a simple real time imaging technique recently developed to access any inclined cross section of a thick sample Despite its experimental demonstration implemented by tilted remote focusing the optical resolution of the method has not been fully understood The anisotropic resolving power in high NA OPM is rigorously investigated and interpreted by deriving the vectorial point spread function PSF and vectorial optical transfer function OTF Next OPM is combined with stochastic

optical reconstruction microscopy STORM to achieve super resolution deep imaging The proposed method termed obliqueSTORM together with oblique lightsheet illumination paves the way for deeper penetration readily available in localization based super resolution microscopy The key performance metrics of obliqueSTORM quantitative super resolution and axial depth of field are studied obliqueSTORM could achieve sub 50 nm resolution with a penetration depth of tens of microns for biological samples The last part of the thesis covers the development of nonparaxial imaging theory of high NA differential phase contrast DPC microscopy for high resolution quantitative phase imaging The phase retrieval in conventional optical DPC microscopy relies on the paraxial transmission cross coefficient TCC model However this paraxial model becomes invalid in high NA DPC imaging Formulated here is a more advanced nonparaxial TCC model that considers the nonparaxial nature of light propagation apodization in high NA imaging systems and illumination source properties The derived nonparaxial TCC is numerically compared with the paraxial TCC to demonstrate its added features The practical forms of the TCC for high resolution phase reconstruction are discussed for two special types of objects weak objects and slowly varying phase objects The theoretical studies conducted here can help to bring such high NA microscopy techniques into the real world to solve imaging challenges
