Advances In Mobile Information Systems:

Mobile Information Systems Elaine Lawrence, Barbara Pernici, John Krogstie, 2004-08-30 Mobility is perhaps the most important market and technological trend within information and communication technology. With the advent of new mobile infrastructures providing higher bandwidth and constant connection to the network from virtually everywhere the way people use information resources is predicted to be radically transformed. Over the last years a new breed of information systems referred to as mCommerce systems or mobile information systems has appeared to address this emerging situation. In 2000 the IFIP 8.1 WG decided to look into establishing a task group to look closer at this area and the idea was adopted and extended by IFIP TC8 the following year. After the arrangement of several workshop this task group has been the driving force behind the arrangement of MOBIS IFIP TC 8 Working Conference on Mobile Information systems held in Oslo Norway 15-17 September 2004. The objective of the working conference was to provide a forum for researchers and practitioners interested in planning, analysis, design, construction, modification, implementation, utilization, evaluation and management of mobile information systems to meet and exchange research ideas and results. Specifically we tried to use the working conference to clarify differences and similarities between the development of mobile vs more traditional information systems. Investigate organizational impact of mobile information systems. Investigate mobile commerce applications combined with the advantages of mobile communications technologies. X Mobile Information Systems. Evaluate existing and newly developed approaches for analysis, design, implementation and evolution of mobile information systems.

Advanced Microsystems for Automotive Applications 2010 Gereon Meyer, Jürgen Valldorf, 2011-02-11 The automobile of the future has to meet two primary requirements: the super-efficient use of energy and power and the ultra-safe transportation of people and goods. Both features are increasingly enabled by smart, adaptive and context-aware information and communication technologies. ICT, electrical or electronic components and systems rather than solely by the mechanical means of classic automotive engineering. The most advanced example of this trend is the electrified vehicle combining a full electric powertrain with completely electronic controls like smart power and energy management by wire technologies and intelligent networking capabilities allowing all providers and consumers of energy to work in efficient synergy. In the course of this year the first series production electric vehicles will finally come into the market. Automakers unsure if electric vehicles would really sell have long time been hesitant to make the necessary changes of their product portfolios. In the coincidence of economic crisis and growing concerns about global warming and energy security companies and public authorities jointly succeeded to overcome many obstacles on the path towards electrification.
