Targeted Therapies in Cancer Marc Lacroix, 2014-01-01 Since the year 2000 exciting developments in cancer therapy have occurred For decades in the 20th century the hallmark of medical treatment for cancer had been cytotoxic chemotherapy with drugs targeting rapidly dividing cells including cancer cells but also certain normal tissues As a result many patients experienced the classic toxicities of alopecia gastrointestinal symptoms and or myelosuppression In the last years however clinical research has been strongly occupied with the identification of mutations and aberrations concerning molecular pathways in cancer and their alterations which has enabled the emergence of a targeted somewhat personalized medicine approach to treatment Today although traditional cytotoxic chemotherapy remains the treatment of choice for many malignancies notably as first line agents targeted therapies are a possible choice for many types of cancer including breast prostate CRC lung kidney cancers as well as lymphoma leukemia and myeloma More than 60 of these targeted therapies recently approved by the United States Food and Drug Administration FDA are detailed in the book and their intended use in one or more cancer types are shown
