How Landscapes Change Gay A. Bradshaw, Pablo Marquet, 2002-12-06 North and South America share similar human and ecological histories and increasingly economic and social linkages As such issues of ecosystem functions and disruptions form a common thread among these cultures This volume synthesizes the perspectives of several disciplines such as ecology anthropology economy and conservation biology The chief goal is to gain an understanding of how human and ecological processes interact to affect ecosystem functions and species in the Americas Throughout the text the emphasis is placed on habitat fragmentation At the same time the book provides an overview of current theory methods and approaches used in the analysis of ecosystem disruptions and fragmentation **National Park Science** Jane Carruthers, 2017-08-17 This book explains the changing philosophies and permutations in research and management of South Africa's national parks during the twentieth century [Ecology Abstracts](#), 1987 Indexes journal articles in ecology and environmental science Nearly 700 journals are indexed in full or in part and the database indexes literature published from 1982 to the present Coverage includes habitats food chains erosion land reclamation resource and ecosystems management modeling climate water resources soil and pollution *The Diversity of Life* Edward O. Wilson, 1992 View a collection of videos on Professor Wilson entitled On the Relation of Science and the Humanities In the Amazon Basin the greatest violence sometimes begins as a flicker of light beyond the horizon There in the perfect bowl of the night sky untouched by light from any human source a thunderstorm sends its premonitory signal and begins a slow journey to the observer who thinks the world is about to change Watching from the edge of the Brazilian rain forest witness to the sort of violence nature visits upon its creatures Edward O. Wilson reflects on the crucible of evolution and so begins his remarkable account of how the living world became diverse and how humans are destroying that diversity Wilson internationally regarded as the dean of biodiversity studies conducts us on a tour through time traces the processes that create new species in bursts of adaptive radiation and points out the cataclysmic events that have disrupted evolution and diminished global diversity over the past 600 million years The five enormous natural blows to the planet such as meteorite strikes and climatic changes required 10 to 100 million years of evolutionary repair The sixth great spasm of extinction on earth caused this time entirely by humans may be the one that breaks the crucible of life Wilson identifies this crisis in countless ecosystems around the globe coral reefs grasslands rain forests and other natural habitats Drawing on a variety of examples such as the decline of bird populations in the United States the extinction of many species of freshwater fish in Africa and Asia and the rapid disappearance of flora and fauna as the rain forests are cut down he poignantly describes the death throes of the living world's diversity projected to decline as

much as 20 percent by the year 2020 All evidence marshaled here resonates through Wilson's tightly reasoned call for a spirit of stewardship over the world's biological wealth He makes a plea for specific actions that will enhance rather than diminish not just diversity but the quality of life on earth Cutting through the tangle of environmental issues that often obscure the real concern Wilson maintains that the era of confrontation between forces for the preservation of nature and those for economic development is over he convincingly drives home the point that both aims can and must be integrated Unparalleled in its range and depth Wilson's masterwork is essential reading for those who care about preserving the world biological variety and ensuring our planet's health *Animal Agriculture and Natural Resources in Central America: Strategies for Sustainability*, Seeds and Sovereignty Jack Ralph Kloppenburg,1988-06-06 Seeds for economically important crops are big business indeed As large seed companies continue to improve their product in various ways they make use of the original gene pools of these plants often located in tropical and subtropical areas of the world With increasing recognition that plant germplasm is an important raw material highly charged international disputes have developed over the exchange and use of this material adding another point of contention between poor nations and the manufacturing wealthier ones Twenty experts from several nations representing both the natural and social sciences consider the historical background the issue of patent rights as applied to plant germplasm the nature of global genetic interdependence the internationalization of the seed industry the implications of biotechnology on genetic resources the Third World attitude toward the debate and the viewpoints of the International Agricultural Research Centers Nature's End S.
