## **Advances In Downs Syndrome:**

Advances in Down Syndrome Research Gert Lubec,2003-12-19 Advances in Down Syndrome Research represents updated research in several areas of Down Syndrome DS A new promising animal model of DS is reported and this opens new opportunities to study pathomechanisms and pharmacological approaches as it is more than difficult to carry out studies in humans and the clinical features are highly variable In terms of biology cell cycle and stem cell studies and in terms of biochemistry relevance of studies on a specific protein kinase channels transporters superoxide dismutase antioxidant system chromosome assembly factor and other important biological structures are provided And again the gene dosage hypothesis is addressed and although the vast majority of chromosome 21 gene products is unchanged in fetal DS brain a few specific chromosome 21 encoded structures including transcription factors are indeed overexpressed although findings in fetal DS are different from those in adult DS brain when Alzheimer like neuropathology supervenes *Down Syndrome* Ira T.

Lott,Ernest E. McCoy,1992-05-07 Focuses entirely on health care of people with Down Syndrome throughout their life span from birth to old age With the remarkable strides that have been made in research and medicine in the past decade people with Down Syndrome are living longer and healthier lives and are actively participating in all aspects of community life Health care is a critical factor in this process The first section explores the genetic basis for Down Syndrome as well as discusses speech and language development in children the second section highlights clinical advances in treatment

begin to heal or prevent such malformation without the need to resort to invasive surgery Further susceptible mutation screening in women will also be helpful for both prenatal diagnosis of DS birth and assessing the risk of predisposition to Alzheimer s disease and congenital heart disease Stress condition and neurodegeneration are two important markers in Down syndrome patients and mtDNA variation can also be used as an important biomarker It has been suggested that nutraceuticals which reduce reactive oxygen species ROS level may be used to treat trisomy 21 condition As mitochondria play a crucial role in the regulation of free radicals only a detail analysis will reveal the origin of phenotypic characteristics among trisomy 21 DS patients On the other hand several mechanisms are responsible for neurodegeneration as well as altered cognition It includes impaired neurogenesis leading to hypocellularity in the cortex hippocampus and cerebellum altered dendritic morphology altered synapses increased inhibition and neurodegeneration The new knowledge of the pathogenic mechanisms in DS individuals has been acquired from mouse model These studies provide the basis for developing new drugs for clinical trials in DS individuals and to sustain the hope that some of these drugs will be useful in treating intellectual disability in DS individuals
