

The Standardized Live Patient and Mechanical Patient Models—Their Roles in Trauma Teaching

Jameel Ali, MD, M. Med. Ed., Khalid Al Ahmad, MD, Jack Ivan Williams, PhD, and Robert Allen Cherry, MD

Background: We have previously demonstrated improved medical student performance using standardized live patient models in the Trauma Evaluation and Management (TEAM) program. The trauma manikin has also been offered as an option for teaching trauma skills in this program. In this study, we compare performance using both models.

Methods: Final year medical students were randomly assigned to three groups: group I (n = 22) with neither model, group II (n = 24) with patient model, and group III (n = 24) with mechanical model using the same clinical scenario. All students completed pre-TEAM and post-TEAM multiple choice question (MCQ) exams and an evaluation questionnaire scoring five items on a scale of 1 to 5 with 5 being the highest. The items were objectives were met, knowledge improved,

skills improved, overall satisfaction, and course should be mandatory. Students (groups II and III) then switched models, rating preferences in six categories: more challenging, more interesting, more dynamic, more enjoyable learning, more realistic, and overall better model. Scores were analyzed by ANOVA with $p < 0.05$ being considered statistically significant.

Results: All groups had similar scores (means \pm SD) in the pretest (group I = 50.8 ± 7.4 , group II = 51.3 ± 6.4 , group III = 51.1 ± 6.6). All groups improved their post-test scores, but groups II and III scored higher than group I with no difference in scores between groups II and III (group I = 77.5 ± 3.8 , group II = 84.8 ± 3.6 , group III = 86.3 ± 3.2). The percent of students scoring 5 in the questionnaire are as follows: objectives met – 100% for all groups; knowledge improved: group I = 91%, group II = 96%,

group III = 92%; skills improved: group I = 95%, group II = 83%, group III = 96%; overall satisfaction: group I = 91%, group II = 92%, group III = 92%; should be mandatory: group I = 32%, group II = 96%, group III = 100%. Student preferences (48 students) are as follows: the mechanical model was more challenging (44 of 48); more interesting (46 of 48); more dynamic (46 of 48); more enjoyable (48 of 48); more realistic (32/48), and better overall model (42 of 48).

Conclusions: Using the TEAM program, we have demonstrated that improvement in knowledge and skills are equally enhanced by using mechanical or patient models in trauma teaching. However, students overwhelmingly preferred the mechanical model.

Key Words: Trauma teaching, Standardized patient, Mechanical patient model.

Clinical teachers face many challenges in providing training in patient management for students and physicians. Among these challenges are the inability to provide direct real live patient contact in a structured teaching environment with opportunities for interaction, ethical considerations concerning the impact on patient care, the increased time and resources required for training in live patient situations, and the lack of opportunity to provide training in a preset schedule for specific entities in real live clinical situations.

Although there is general consensus that didactic lectures and discussions play an important role in improving knowledge base, the acquisition of clinical skills important to patient management require more direct teacher–student interaction. Many

attempts have been made to address these issues including the use of mechanical models,^{1–3} establishment of surgical skills laboratory, and standardized patient modules.^{4–6}

The Trauma Evaluation and Management (TEAM) program introduces students to Advanced Trauma Life Support (ATLS) resuscitation concepts and is promulgated through the American College of Surgeons, Committee on Trauma. Previous studies have demonstrated improvement in trauma knowledge and clinical skills among senior medical students completing this program.^{7–10} The new version of the TEAM program provides options for the use of standardized live trauma patient models as well as mechanical computerized models for teaching trauma concepts.

The TEAM program has been described in our previous publications.^{7–10} Briefly, it consists of a short video demonstration of management of a patient with multiple injuries with significant management errors which are discussed by the students. The discussion of the video is followed by a slide lecture presentation consisting of an expansion of the ATLS initial assessment lecture and supplemented by highlights from the other chapters of the ATLS manual.¹¹ At the end of the slide lecture presentation, a second video is shown in which the previously committed errors in management are corrected and further discussed. Optional components of the TEAM program include focused discussions of trauma sce-
