

Chapter 5 – Elasticity and Its Applications

Do they depend upon the answers to these questions?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Key Issues:

How do we measure the responsiveness of one variable

to a change in another variable, and especially, will the responses be linear?

How can a rise in the price of a good affect the opportunity cost of your time, as well as the timing of spending your time on leisure?

How can a decrease in the price of a good lead to higher expenditures if you spend your good? How does that happen? How much will your demand fall, or might it even increase?

Key Issues:

- Does your elasticity measure how much the variable responds to changes in another variable?
 - One type of elasticity measures how much demand for one variable will fall if another variable rises.
- Definition:
 - Elasticity is a numerical measure of the responsiveness of Q^D or Q^S to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values for positive numbers.

Example:

The price elasticity of demand for apples is 0.50. If the price of apples falls 10 percent, the quantity demanded will

Calculate Percentage Change

Quantity =

$$P \text{ falls 10\% (falls 10\% elasticity } \times \text{ (10\%)} = 10)$$

Quantity will

increase 10% (falls 10% elasticity \times (10\%)} = 10)
