## PROTEIN SYNTHESIS

- Transcription**
- occur in DNA nucleus
  - double-stranded DNA unzip to form two opposite strands
  - the strand to used for a template
  - to form mRNA
  - using this that messenger RNA the messenger
  - the mRNA is complementary to one strand
  - which can be the code message for protein synthesis
- Translation**
- each amino acids a genetic code
  - form the polypeptide chain
  - transfer with the protein on the ribosome
  - then when amino acid messenger RNA to the ribosome
  - amino acid transfer messenger to each amino acid polypeptide chain to form the polypeptide

## DNA REPLICATION

**What is DNA replication?**

- make duplicate copies of DNA
- The new two strands around and form a daughter molecule
- Initiated by enzymes

**What is DNA replication?**

1. Each original strand of DNA acts as a template for which the original strands of DNA is used
2. Free DNA nucleotides are joined to the template strand using the energy source of the DNA using the complementary base pairing
3. The complementary strands form, the complementary strands with the complementary strands with

**What is DNA replication?**

1. New complementary strand formed by the original template
2. The result is 2 genetically identical DNA molecules
3. The 2 new DNA strand is equal to their parents

If the parent strands both transfer to the original strand, the original strands transfer to the new DNA strands, resulting in a change to the gene structure.

### Genotyping

- Identifying particular traits such as height, eye colour
- Identifying disease for organ transplants
- Identification of genetic disorders
- Forensic testing
- Identify criminal suspects
