

Alternative gaseous fuels in port fuel injection spark ignition engines

I. Sezer*

This paper investigates the use of alternative gaseous fuels in port fuel injection spark ignition engines via the Lotus engine simulation program. To this end, the engine model for a port fuel injection spark ignition engine was designed, and engine performance was determined separately for gasoline and alternative gaseous fuels, i.e. compressed natural gas and liquefied petroleum gas. According to the results, brake thermal efficiency increases while engine performance and fuel consumption decrease with methane and propane when compared to gasoline under the same conditions. While a slight increase in the fuel/air equivalence ratio of gaseous fuels improves the engine performance, fuel consumption remains almost stable. Another factor that enhances engine performance is the increasing compression ratio for methane and propane. In this manner, performance values that are closer/equal to gasoline are achieved. Under these conditions, fuel consumption decreases notably, while significant increases are observed in brake thermal efficiency.

Introduction

A combination of several concerns emerging following the oil crises of 1970s, such as an increasing awareness towards environmental issues, energy security and fuel conservation goals, has drawn attention to alternative fuels.¹⁻³ Some recent events, including the high pump prices of gasoline and diesel fuel and the continuous stringent emission regulations, have also intensified such concerns. The term 'alternative fuel' is commonly used for energy sources that are non-petroleum based and whose combustion generates lower emissions compared
