

Nature vs. Nurture

Biologists' theories on how environmental influences modify genetic inheritance have always been necessary because of the obvious fact that a single gene is insufficient to explain the development of an individual. However, the discovery of the DNA double helix structure in 1953 and the subsequent discovery of the genetic code in 1961, as well as the development of the techniques for cloning and sequencing DNA, have provided a more complete picture of the genetic code and its role in the development of an individual.

Biologists' theories on how genetic inheritance influences human development are still in the process of being refined. While it is clear that genes play a role in the development of an individual, the extent of their influence is still being debated. Some researchers believe that genes are the primary influence on the development of an individual, while others believe that the environment plays a more significant role. The debate is still ongoing, and it is clear that the answer is not as simple as it once was.

In contrast to the traditional view of genetics, which held that genes were the primary influence on the development of an individual, the discovery of the DNA double helix structure in 1953 and the subsequent discovery of the genetic code in 1961, as well as the development of the techniques for cloning and sequencing DNA, have provided a more complete picture of the genetic code and its role in the development of an individual.
