Chemical Kinetics Of Homogeneous Systems:

Chemical Kinetics of Homogeneous Systems R. Schaal, 2012-12-06 Chemical kinetics aims to explain the factors governing the change with time of chemical systems. The results enable one to define optimum technico economic conditions such as the choice of batch or continuous processes of concentration temperature and pressure of whether to use a catalyst for the preparation of products so that kinetics is intimately bound up with many processes of chemical industry production explosions combustion propulsion in air and in space. On another level kinetic studies are indispensable for understanding reaction mechanisms which implies a detailed knowledge of the different chemical intermediates possibly very transitory of a chemical reaction. But in practice it is rarely possible to work with microscopic quantities of reagents and with the exception of crossed molecular beams all methods give only statistical results concerning a large number of molecules. Because of this restriction it has not always been possible to establish conclusively a reaction mechanism even for reactions apparently simple. Numerous attempts have been made to calculate rate constants from the physical properties of the participating molecules but the introduction of the time factor into calculations of the distribution of energies of chemical processes makes this very difficult so that the elucidation of mechanisms still depends almost entirely on experimental studies. However several theories have been elaborated which in giving a more and more precise picture of the reaction process have proved very fruitful and have become indispensable in designing experiments.

for Chemical Engineers Stanley M. Walas, 2013-10-22 *Reaction Kinetics for Chemical Engineers* focuses on chemical kinetics including homogeneous reactions nonisothermal systems flow reactors heterogeneous processes granular beds catalysis and scale up methods. The publication first takes a look at fundamentals and homogeneous isothermal reactions. Topics include simple reactions at constant volume or pressure material balance in complex reactions homogeneous catalysis effect of temperature energy of activation law of mass action and classification of reactions. The book also elaborates on adiabatic and programmed reactions continuous stirred reactors and homogeneous flow reactions. Topics include nonisothermal flow reactions semiflow processes tubular flow reactors material balance in flow problems types of flow processes rate of heat input constant heat transfer coefficient and nonisothermal conditions. The text ponders on uncatalyzed heterogeneous reactions fluid phase reactions catalyzed by solids and fixed and fluidized beds of particles. The transfer processes in granular masses fluidization heat and mass transfer adsorption rates and equilibria diffusion and combined mechanisms diffusive mass transfer and mass transfer coefficients in chemical reactions are discussed. The publication is a dependable source of data for chemical engineers and readers wanting to explore chemical kinetics.
