Deuterium And Shift Calculation:

Deuterium and Shift Calculation, 2012-12-06 In 1931 Vrey Brickwedde and Murphy discovered the hydrogen isotope deuterium The isotopic enrichment was found to arise from the fact that the electrolysis of light water is faster than of heavy water 1 2 This success showed that although different isotopes of an element behave identically from a chemical standpoint the different isotopic masses nevertheless lead to both isotope effects on equilibrium as well as on rate constants of chemical reactions Soon ratios of equilibrium constants of isotopic reactions were called equilibrium isotope effects EIE ratios of isotopic rate constants kinetic isotope effects KIE Isotope effects have been found to be especially large for those elements which are directly involved in bond breaking and bond formation during the reaction studied 3 Such effects are therefore referred to as primary Isotopic substitution in atomic sites which maintain all chemical bonds with their neighbors during the reaction of interest leads then only to smaller secondary isotope effects Because of the unique mass relation between the different hydrogen isotopes hydrogen deuterium isotope effects are particularly large and have attracted most attention The largest contributions to these effects arise from changes in the vibrational frequencies of the reactants The theory of equilibrium isotope effects has been founded by Vrey 4 and Bigeleisen 5 6 and has widely been accepted 3

Calculation of NMR and EPR Parameters Martin Kaupp, Michael Bühl, Vladimir G. Malkin, 2006-03-06 This is the first book to present the necessary quantum chemical methods for both resonance types in one handy volume emphasizing the crucial interrelation between NMR and EPR parameters from a computational and theoretical point of view Here readers are given a broad overview of all the pertinent topics such as basic theory methodic considerations benchmark results and applications for both spectroscopy methods in such fields as

biochemistry bioinorganic chemistry as well as with different substance classes including fullerenes zeolites and transition metal compounds The chapters have been written by leading experts in a given area but with a wider audience in mind The result is the standard reference on the topic serving as a guide to the best computational methods for any given problem and is thus an indispensable tool for scientists using quantum chemical calculations of NMR and EPR parameters A must have for all chemists physicists biologists and materials scientists who wish to augment their research by quantum chemical calculations of magnetic resonance data but who are not necessarily specialists in these methods or their applications Furthermore specialists in one of the subdomains of this wide field will be grateful to find here an overview of what lies beyond their own area of focus
