Complex Systems And Cognitive Processes:

Complex Systems and Cognitive Processes Roberto Serra, Gianni Zanarini, 2013-11-11 This volume describes our intellectual path from the physics of complex systems to the science of artificial cognitive systems It was exciting to discover that many of the concepts and methods which succeed in describing the self organizing phenomena of the physical world are relevant also for understanding cognitive processes Several nonlinear physicists have felt the fascination of such discovery in recent years In this volume we will limit our discussion to artificial cognitive systems without attempting to model either the cognitive behaviour or the nervous structure of humans or animals On the one hand such artificial systems are important per se on the other hand it can be expected that their study will shed light on some general principles which are relevant also to biological cognitive systems The main purpose of this volume is to show that nonlinear dynamical systems have several properties which make them particularly attractive for reaching some of the goals of artificial intelligence The enthusiasm which was mentioned above must however be qualified by a critical consideration of the limitations of the dynamical systems approach Understanding cognitive processes is a tremendous scientific challenge and the achievements reached so far allow no single method to claim that it is the only valid one In particular the approach based upon nonlinear dynamical systems which is our main topic is still in an early stage of development

The Economy As An Evolving Complex System II W. Brian

Arthur, Steven N Durlauf, David Lane, 2018-05-04 A new view of the economy as an evolving complex system has been pioneered at the Santa Fe Institute over the last ten years This volume is a collection of articles that shape and define this view a view of the economy as emerging from the interactions of individual agents whose behavior constantly evolves whose strategies and actions are always adapting The traditional framework in economics portrays activity within an equilibrium steady state The interacting agents in the economy are typically homogenous solve well defined problems using perfect rationality and act within given legal and social structures The complexity approach by contrast sees economic activity as continually changing continually in process The interacting agents are typically heterogeneous they must cognitively interpret the problems they face and together they create the structures markets legal and social institutions price patterns expectations to which they individually react Such structures may never settle down Agents may forever adapt and explore and evolve their behaviors within structures that continually emerge and change and disappear structures these behaviors co create This complexity approach does not replace the equilibrium one it complements it The papers here collected originated at a recent conference at the Santa Fe Institute which was called to follow up the well known 1987 SFI conference organized by Philip Anderson Kenneth Arrow and David Pines They survey the new study of complexity and the economy They apply this approach to real economic problems and they show the extent to which the initial vision of the 1987 conference has come to fruition
