

Energy Use and Conservation

What is Energy Conservation?

To understand energy conservation, we must first understand why energy needs to be conserved. Energy is everywhere. It's used to power lights, move trains, cell phones and other personal devices, and much more.

Energy is used to heat our homes in the winter and cool

them in the summer. The problem is that energy is costly to produce and it's not necessarily used efficiently.

Most of the world's energy is made from the burning of fossil fuels. Almost all of the world's fossil fuels make up 87% of total energy consumption. Nuclear power makes up about 10% of total

International Energy Agency

electricity production in 2014 and is expected to grow 12% per year over the next few decades. Fossil fuels and nuclear energy are **nonrenewable resources**, which means they will run out eventually. **Renewable resources**, such as solar and wind energy, are a more

environmentally-friendly way to produce energy. Unlike nonrenewable resources, they do not run out and produce little to no pollution. Unfortunately, renewable resources don't produce enough energy for our global needs. There are over 7 billion people on Earth, most of whom use huge

amounts of energy. It's a typical day for people of nonrenewable resources to be defueling. In addition, every nonrenewable energy source releases pollution, in the form of carbon dioxide, smog, and nuclear waste. These byproducts pose a threat not only to the natural world (in the form of global warming, ozone depletion, and environmental contamination), but to our own health. The vast majority of available green fuel comes from forests and other greenlands, part of the atmosphere are primarily responsible for **global warming**, which is leading to rising sea levels, changing weather patterns, increasing storms, and forest wildfires. Long-term

is improving practices and use renewable energy sources options. Performance the this energy use on the non-renewable resources.

Energy conservation is a part of our lifestyle that people do not even think about. It's how we light up when we leave the room and take long hot showers. We crank up the heat in the winter and shut the air conditioning in the summer. **Energy conservation** (which also means) will reduce harmful emissions, slow the loss of nonrenewable resources, and save resources money. We need to live more responsibly if we want our descendants to enjoy the same quality of life and have the same rich space and space for us to do.
