Composition Geochemistry And Conversion Of Oil Shales:

Composition, Geochemistry and Conversion of Oil Shales C.E. Snape, 2012-12-06 Oil shales are broadly defined as petroleum source rocks containing sufficiently high contents of organic matter above ca 10-15 wt % to make utilisation a possibility. Like coal, the world's reserves of oil shales are vast, being many times larger than those proven for crude oil. Indeed, some of the largest deposits occur in the USA and Europe, where Estonia and Turkey have large reserves. The first recorded interest in oil shale retorting was an English patent in 1694 by Ee-le Hancock and Porter No 330, which refers to distilling naphtha from some kind of stone. The oil shale retorting industry dates back to the middle of the last century, notably Scotland, Estonia, France, and Sweden in Europe. Indeed, my own Department at the University of Strathclyde has a historical link with James Paraffin Young, the founder of the Scottish oil shale industry, who endowed a chair in Applied Chemistry. The growth of the oil industry saw the demise of the oil shale industry in most countries, with the notable exception of Estonia, where kokersite has continued to be used for power generation and retorting. However, oil shale utilisation has attracted renewed attention since the early 1970s as a source of transport fuels and chemical feedstocks, due to the long-term uncertainties over crude oil supplies.

Composition, Geochemistry and Conversion of Oil Shales C. E. Snape, 2014-01-15 *The Chemistry and Technology of Petroleum, Fifth Edition* James G. Speight, 2014-02-26 With demand for petroleum products increasing worldwide, there is a tendency for existing refineries to seek new approaches to optimize efficiency and throughput. In addition, changes in product specifications due to environmental regulations greatly influence the development of petroleum refining technologies. These factors underlie the need for this fifth edition of *The Chemistry and Technology of Petroleum*, which continues in the tradition of the bestselling fourth edition, providing readers with a detailed overview of the chemistry and technology of petroleum as it evolves into the twenty-first century. The new edition has been updated with the latest developments in the refining industry, including new processes as well as updates on evolving processes and various environmental regulations. The book covers issues related to economics and future refineries, examines the changing character of refinery feedstock, and offers new discussions on environmental aspects of refining. It contains more than 300 figures and tables, including chemical structures and process flow sheets. A useful reference for scientists and engineers in the petroleum industry, as well as in the catalyst manufacturing industry, this book introduces readers to the science and technology of petroleum, beginning with its formation in the ground and culminating in the production of a wide variety of products and petrochemical intermediates.

The Environmental Management of Low-grade Fuels M. E. MacDonald, Michael J. Chadwick, G. S. Aslani, 1996 Low grade fuels are those with a low calorific value per unit weight such as peat wood lignite and municipal waste consequently they frequently emit a higher percentage of pollutant material after use than higher grade fuels Methods to reduce or eliminate environmental damage caused by these pollutants do exist but are often relatively costly This book offers specific realistic strategies and policy options for managing these fuels with a minimum of damage to the environment

Solid Fuels and Heavy Hydrocarbon Liquids: Thermal Characterization and Analysis Rafael Kandiyoti, Alan Herod, Keith Bartle, 2006-04-06 The first strand involves a critical overview of the design of experimental methods used for examining the thermal behaviour of solid fuels pyrolysis liquefaction and gasification while the second will emphasise chemical structures and molecular mass distributions of coal derived tars extracts and pitches petroleum derived asphaltenes and biomass derived heavy hydrocarbon liquids Two major interdependent strands in the study of fossil and renewable fuel utilisation are focused on within this text i Thermal characterisation of solid fuels including various ranks of coals biomass and waste and ii The analytical characterisation of heavy hydrocarbon liquids covering coal petroleum and biomass derived heavy fractions
