

Protostar looks like a star, but its core is not yet hot enough for nuclear fusion.

Main sequence stars fuse hydrogen atoms to helium atoms in their cores.

As the Large Red Giant condenses, it heats up even further, burning the last of its hydrogen and causing the star's outer layers to expand further.

A Red Giant is formed when a star runs out of hydrogen at its core and starts fusing hydrogen into helium outside the core, releasing energy and expanding the star.

Large Red Giants are hot enough to turn the helium at their core into heavy elements like carbon.

A Supernova can be triggered

1. by the sudden re-ignition of nuclear fusion in a degenerate star.
2. by the gravitational collapse of the core of a massive star.

Once the star runs out of fuel, it collapses under gravity, and the outer layers are ejected into the vastness of space.

Protons and electrons left after a supernova are forced to combine, to produce a very dense neutron star.

The remains of the star are devoid of fuel. They consist of degenerate matter with a very high density.

If the mass is significantly greater, the gravity will be so strong that the neutron star will shrink further to become a black hole.

A white Dwarf becomes a black dwarf when it stops emitting light.
