Abstract: **Background/Objectives:** Laparoscopic surgery plays a central role in the management of abdominal trauma, particularly in patients with hemodynamic stability. Recently, single-port laparoscopic surgery (SPLS) has emerged as a technique that further reduces access-related trauma while preserving the benefits of conventional laparoscopy. Thus, this review aimed to examine the current landscape of SPLS in trauma care, summarizing available clinical data and highlighting practical considerations for its use. Despite the limited experience, early evidence suggests that SPLS can achieve diagnostic and therapeutic outcomes comparable to those achieved by multi-port approaches in selected cases. Particular attention is given to a hybrid method that combines intracorporeal assessment with extracorporeal small bowel examination and repair through a single umbilical incision. This technique offers a pragmatic balance between thorough exploration and minimal invasiveness. **Methods:** We searched PubMed, Scopus, Web of Science, and Google Scholar through December 2023 using the terms “single-port laparoscopy”, “single-incision laparoscopic surgery”, “trauma laparoscopy”, and related phrases. Case reports, case series, comparative studies, and reviews describing single-incision laparoscopic surgery in trauma were included in this narrative analysis. **Results:** SPLS may offer advantages in terms of postoperative pain, wound complications, and cosmetic outcomes, especially in younger patients. As familiarity with the approach increases and dedicated instrumentation becomes more accessible, its role in trauma protocols may expand. **Conclusions:** Further prospective research is needed to define long-term outcomes, refine patient selection, and integrate SPLS more systematically into trauma care protocols.

1. Introduction

Laparoscopic surgery is an invaluable tool for managing abdominal trauma. Since its first reported use in patients with trauma in the 1970s [1,2], the role of laparoscopy has expanded from purely diagnostic purposes to therapeutic interventions. Compared to open laparotomy, laparoscopy offers numerous advantages, such as reduced postoperative pain, lower wound complication rates, shorter hospital stays, and faster recovery [3,4]. Importantly, diagnostic laparoscopy can accurately identify intra-abdominal injuries with high sensitivity, helping avoid unnecessary non-therapeutic (negative) laparotomies that carry significant risk of morbidity [5,6]. In fact, the selective use of diagnostic laparoscopy in trauma can prevent a negative laparotomy in roughly 20–50% of cases [7,8], sparing
