Lambris,2012-02-04 Complement has long been regarded as a pivotal effector arm of the innate immune response eliciting important immunoregulatory functions in the context of inflammation and also serving as a vital link between the innate and adaptive immune response In the post genomic era our knowledge of the innate immune system is enriched by findings that point to novel functions that do not strictly correlate

with immunological defense and surveillance immune modulation or Inflammation Several studies indicate that complement proteins exert functions that are either more complex than previously thought or go well beyond the innate immune character of the system The advent of high throughput platforms for genome and proteome wide profiling together with the enormous amount of raw genetic information that has accumulated in the databases have stirred new expectations in biomedical research They have led complementologists to revisit established biological systems such as the complement system from a global and integrative perspective Complement research is now faced with the challenge of trying to integrate isolated biochemical pathways into complex gene and protein regulatory circuits In this respect scientists from around the world convened at the Fourth Aegean Conferences Workshop on Complement Associated Diseases Animal Models and Therapeutics June 10 15 2007 to discuss recent advances in this fast evolving field This volume represents a collection of topics on the novel functions of complement patho physiology protein structures design of complement inhibitors and complement assays discussed during the conference

Mediators of the Inflammatory Process Peter M. Henson, Robert C. Murphy, 1989 Inflammation can be defined as a generalized nonspecific but beneficial response of tissues to injury The essential protective role of inflammation can easily be seen in the life threatening genetic diseases in which key elements of the inflammatory reaction are missing or defective The drive to understand the underlying control processes and underlying mechanisms derives however more from the pathological perspective than from elucidating defense of the host to injury and has prompted an enormous effort on the part of the pharmaceutical industry to develop efficient antagonists and inhibitors of the molecules involved in these reactions the inflammatory mediators This volume is intended by the authors to provide information on groups of mediators of inflammation in general and where possible to stimulate interest and comments on the possibilities for participation of these communication molecules mediators in the complex but fascinating process of inflammation
