Abstract

Purpose Prostate biopsy is central to the accurate histological diagnosis of prostate cancer. In current practice, the biopsy procedure can be performed using a transrectal or transperineal route with different technologies available for targeting of lesions within the prostate. Historically, the biopsy procedure was performed solely by urologists, but with the advent of image-guided techniques, the involvement of radiologists in prostate biopsy has become more common. Herein, we discuss the pros, cons and future considerations regarding their ongoing role.

Methods A narrative review regarding the current evidence was completed. PubMed and Cochrane central register of controlled trials were searched until January 2024. All study types were of consideration if published after 2000 and an English language translation was available.

Results There are no published studies that directly compare outcomes of prostate biopsy when performed by a urologist or radiologist. In all published studies regarding the learning curve for prostate biopsy, the procedure was performed by urologists. These studies suggest that the learning curve for prostate biopsy is between 10 and 50 cases to reach proficiency in terms of prostate cancer detection and complications. It is recognised that many urologists are poorly able to accurately interpret multi-parametric (mp)-MRI of the prostate. Collaboration between the specialities is of importance with urology offering the advantage of being involved in prior and future care of the patient while radiology has the advantage of being able to expertly interpret preprocedure MRI.

Conclusion There is no evidence to suggest that prostate biopsy should be solely performed by a specific specialty. The most important factor remains knowledge of the relevant anatomy and sufficient volume of cases to develop and maintain skills.

Introduction

Prostate cancer (PC) is the fifth most common cancer diagnosed worldwide [1]. It contributes to around 375,000 deaths per year and is most common in northern European populations. Ireland, Estonia, Sweden and France harbour the highest age-standardised rate of PC in the world [2]. In the United States, around 60% of cases are diagnosed in patients over the age of 65 [3]. Hereditary factors, family history, and behavioural/environmental factors all contribute to disease development, with one family member developing PC doubling one's risk for developing PC, themselves [2]. Of primary interest in this review is the role of differing specialities in the diagnosis of PC. Specifically, how urologists
