

Additionally, high intake or exhaust restrictions can cause a vacuum between the compressor and the turbocharger housing resulting in oil leaking past the seals.

To verify lubricating oil leakage past the seals, remove the exhaust pipe and crossover tube and look for lubricating oil in the turbine casing and the crossover tube. Locate and correct the restriction as previously discussed.

Turbocharger Noise

It is normal for the turbocharger to emit a "whine" sound that varies in intensity depending on engine speed and load. The sound is caused by the very high rotational speed of the rotor assembly. Consequently, the sound will be more audible at full speed.

If possible, operate the engine at full speed to verify the noise level.

Leaks in the air system intake and/or exhaust components can produce additional noises.

Pressurize the intake system and check for air intake and crossover tube leaks.
