

Adaptive boundary element methods with convergence rates

Tingting Geel Gantumur
McGill University

Abstract

This paper presents adaptive boundary element methods for positive, negative, as well as zero-order operator equations, together with proofs that they converge at certain rates. The convergence rates are quasi-optimal in a certain sense under mild assumptions that are analogous to what is typically assumed in the theory of adaptive finite element methods. In particular, no saturation-type assumption is used. The main ingredients of the proof that constitute new findings are some results on *a posteriori* error estimates for boundary element methods, and an inverse-type inequality involving boundary integral operators on locally refined finite element spaces.

1 Introduction

Let Γ be a (closed or open) polyhedral surface in \mathbb{R}^3 . We consider equations of the form

$$Au = f, \quad (1)$$

where $f \in H^{-t}(\Gamma)$, and $A : H^t(\Gamma) \rightarrow H^{-t}(\Gamma)$ is an invertible linear operator. Strictly speaking, the function spaces should be slightly modified if Γ is an open surface or $t > 0$, but for the sake of this introduction we will gloss over this point. The operators of interest are the *boundary integral operators* that arise from reformulations of boundary value problems as integral equations on the domain boundary, cf. McLean (2000). Then the problem (1) corresponds to a *boundary integral equation*, and a very popular class of methods for its numerical solution is *boundary element methods* (BEM), which can crudely be described as finite element methods (FEM) applied to boundary integral equations, cf. Sauter and Schwab (2011). As with finite elements, there is the adaptive version of BEM, whose main feature is to automatically distribute mesh points hopefully in an optimal way so as to obtain an accurate numerical solution. Even though these methods perform very well in practice, their mathematical theory is not in a very satisfactory state, especially if one compares it with the corresponding theory of adaptive FEM. In the latter context, the sequence of papers Dürfler (1996), Morin, Nochetto, and Siebert (2002), Einev, Dahmen, and DeVore (2004), Stevenson (2007), and Cascon, Kreuzer, Nochetto, and Siebert (2008)
