Adhesion of Solids B. V. Deryagin, N. A. Krotova, Vol'demar Smilga, 1978-09 I am very glad to write a few introductory words to this important book by Professor Deryagin and his colleagues Drs Krotova and Smilga Ever since he first burst on the scientific scene in the 1930s Professor Deryagin has continued to produce papers of seminal value in the general field of surface science particularly those aspects of interest to physical chemists and colloid scientists Many of the ideas introduced by Professor Deryagin and his long list of collaborators have entered into the broad stream of scientific thought Of course not all these ideas have been accepted and some have generated vigorous controversy I am not sure that Professor Deryagin would have it otherwise for I sometimes have the feeling that he enjoys the cut and thrust of the scientific dialectic But none of these differences of opinion can detract from the quality of his work over many decades and from the impact of his contributions to surface science In particular the ideas which he introduced with Landau developed later but quite independently by Verwey and Overbeek in Holland have laid the foundation for the whole of our present approach to colloid stability the DLVO theory A large part of Professor Deryagin's work has been concerned with solid liquid and liquid liquid interactions In the present book he and Drs

Contact, Adhesion and Rupture of Elastic Solids D. Maugis, 2013-03-14 In 1970 an investigation into rubber friction sponsored by a manufacturer of automobile windscreen wipers was being carried out at the Cavendish Laboratory in Cambridge England When a smooth spherical slider of soft rubber was placed in contact with flat glass or perspex the compliance of the rubber enabled it to conform to any slight roughness of the two surfaces such that perfect contact was obtained In these circumstances the surfaces were found to adhere under load the contact area exceeded that predicted by the Hertz theory of elastic contact a contact area of finite size was seen at zero load and a tensile force was required to pull the surfaces apart In an attempt to model these observations the JKR theory Johnson Kendall and Roberts 1971 was born At the same time working in Moscow on adhesion of particles in colloidal suspension Derjaguin Muller and Toporov had developed a different DMT theory of the adhesion of elastic spheres DMT 1975 At first it was thought that these theories were incompatible until Tabor suggested that each applied to opposite ends of the spectrum of a non dimensional parameter which expressed the ratio of the magnitude of the elastic deformation to the range of surface forces This work was followed by Maugis and Barquins in the CNRS Laboratory at Belle Vue who recognised the analogy between adhesion and fracture

Adhesion in Solids, 1988 **Adhesion and the Surface Energy of Solids** Louis A. Girifalco, 1954 **The Invalidity of a Purely Thermodynamic Treatment of the Adhesion of Solids** S. S. Voyuskii, B. V. Deryagin, DEPARTMENT OF THE NAVY WASHINGTON DC., 1965 In view of the appearance of a number of foreign papers where adhesion of polymer adhesives is treated in terms of wetting the present communication discusses the basic principles of the thermodynamics of adhesion It has been pointed out that there is no direct relation between wetting and adhesion of a polymer to a solid A critical discussion has been made of the theory of Sharp and Schonhorn who consider adhesion as due to a spreading of the polymer adhesive along the surface of a substrate and it has been shown that a purely thermodynamic approach to the adhesion of polymers to solids is invalid Author

Adhesion in Solids, 1988 **Adhesion and Cleavage Stress at Interfaces Between Solids and a Pressure-Sensitive Adhesive** C. A. Dahlquist, 1964 The surface free energies of several solids including a series of alkyl esters of cellulose were estimated using recent theories of Zisman Fowkes Girifalco Good and Kraus Using these values the relative works of adhesion between a pressure sensitive adhesive and the solids were estimated The work of adhesion is directly proportional to the critical surface energy of the solid Assuming a covariance between the critical surface energy and the boundary cleavage stress it was shown that the change in peel force was explained reasonably well by the change in work of adhesion The possibility of accounting for the trend in peel force by the variation in tensile strength of the cellulose esters is discounted but the adhesion data for the cellulose esters can be explained qualitatively by the theory of Sharpe and Schonhorn *Adhesion in Solids*, 1988 **Adhesion Associated with Solids and Liquids** Kumud Chaurasia, 2007 *The Dental Register*, 1895 **Mechanism of Adhesion Between Solids** F.
